## Executive Summary

PCSIAAO was contracted by the City of Madison to conduct a ratio study of sales occurring during the current revaluation of the city. The City delivered a set of sales with identifying variables that allowed PCS to stratify the study in several meaningful ways. Overall, the study revealed a quality reappraisal effort, with both residential and commercial properties appraised within acceptable standards of appraisal level and equity.

## Ratio Statistics

This study was conducted in accordance with guidelines established within the Standard on Ratio Studies promulgated by the International Association of Assessing Officers. That standard suggests that when ratios of the appraised values of parcels to their selling prices are arrayed by value that the median value in that array should fall within a range from 0.95 to 1.10 , with 1.00 representing a perfect match of appraised value to selling price. Time of the sale is always a consideration, which is why the study stratified sales by the sale year. The median ratio for both commercial and residential properties was well within the acceptable range for both 2018 and 2019.
Ratio studies cannot rely only on the median, since that ratio alone may fall within an acceptable range while the remainder of the sample varies significantly. In order to examine that variation and measure it, the analyst uses several tools. First, confidence intervals are calculated around the median. One ratio could fall at or near 1.00 purely by chance. Statisticians use what they refer to as confidence intervals to help them examine the true variation. Without going into the mathematics behind it, our study displays the $95 \%$ confidence intervals around the median. In other words, we can be $95 \%$ confident that the true median for a given sample falls between the lower bound (LB) and the upper bound (UB). We would expect those bounds to be very close to the median during the year of the reappraisal and to start to diverge in later years.

Another measure of the variation in ratios is the coefficient of dispersion which expresses the average difference between each ratio and the median as a percentage of the median. That difference is expressed

314 W 10 th St, Kansas City, Missouri 64105-1616 USA
$816 / 701-8100$, Fax $816 / 701-8149,800 / 616-4226$, www.iaao.org
in absolute terms, in other words absent either positive or negative signs, because the analyst is only concerned with variation, whether high or low. The high end of the range for a commercial COD is 20 and that of residential property at 15 .

Finally, we looked at variation relative to the value of the property, which attempts to respond to the question of whether the appraiser is treating all properties fairly relative to their value. An ongoing problem in mass appraisal is that sales do not occur with the same frequency for every value level. Instead, sales tend to cluster around a center point with fewer sales occurring at either the upper or lower levels. Unless the appraiser adjusts for this fact, that mass of sales in the middle will tend the pull the appraised value of high valued properties down while lifting the appraised value of lower value properties. This phenomenon has been called regressivity. If the opposite of that phenomenon is found, it is called progressivity, both of which are measured using the price related differential. The acceptable range for the PRD is from 0.98 to 1.03 . Any measurement above 1.03 is considered regressive and anything below 0.98 is considered progressive.

## Results

The complete ratio study reports are included in the Appendix. They were completed by Paul Bidanset using the data provided and input into the R software.

The overall ratio statistics fell within acceptable ranges with the exception of the PRD for 2018 sales of commercial property. It fell one point outside the acceptable range, which indicates a need to watch that particular property class in the future, but it is not alarming. The median and COD for that class and year are excellent. The statistics for 2019 are also very good, including the PRD.

The breakdown by Assessment Area reveals some areas that need further review. The ratio statistics that appear to fall out of acceptable ranges are shaded for easier identification. For example, Area 7048 shows a COD of 16.81 and a PRD of 1.07 , both of which are beyond acceptable ranges. The reader should be cautioned about drawing too fine a point however, since there were only five sales reported for that area. Smaller samples produce less reliable statistics than larger samples. In addition, this area is comprised exclusively of parking spaces, which present a unique appraisal challenge.

The one area that raises a concern involves the sales of land. There aren't very many sales involved in any of the samples, but the ratio statistics reflect significant deviation from acceptable ranges. Area 114, with the largest number of sales registered a median of 3.03 and even the lower bound of 1.75 is higher than the high point of the acceptable range and 1.1. The coefficient of dispersion is almost double the acceptable level for vacant land of 25 . Further disclosure of information from the assessor's office reveals, however, that some of these land parcels are in transition from an agricultural use valuation set by the state and true market value. Because the value was established by the state, they should be excluded from further consideration in evaluating the local reappraisal effort.
