BACKGROUND
INTRODUCTION

The East Washington Avenue BUILD Capitol Gateway Corridor Plan is an initiative of the City of Madison to provide a critical framework for addressing the significant land use and design issues for the area centered on East Washington Avenue from East Mifflin to East Main Streets between Blair and First Streets - one of the most prominent corridors to the Capitol and the heart of our community and our region. In late 2004, the City of Madison was awarded a $25,000 matching grant from Dane County BUILD (Better Urban Infill Development) Program and received additional funds from area businesses and a neighborhood association to develop a focused vision for the Corridor.

The planning process for the development of this plan began in earnest in February 2005 with the appointment of a 20-member Steering Committee and selection of Vandewalle & Associates as the urban design/planning consultant. In addition, the East Isthmus Neighborhoods Planning Council (ENPC) was retained to facilitate the Steering Committee and public meetings. Public outreach in the process included: over a dozen “stakeholder interviews” conducted by Vandewalle & Associates in February and March 2005 with land owners and business owners within the Corridor; a public meeting in March 2005 to review past planning efforts within the study area and an exercise facilitated by ENPC and Vandewalle & Associates to determine neighborhood/public priorities for the study area; 14 Steering Committee Meetings held between March 2005 and October 2006, all of which provided opportunities for additional public comment; and a public open house and presentation of the draft plan in November 2005.

Throughout the process, drafts of the report were prepared by Vandewalle and extensively modified by the Committee. After a draft plan was completed, City staff recommended significant changes. On October 11, 2006, the Committee adopted all the changes recommended by the City staff and adopted the report, including those changes.

Following completion of the Steering Committee report in November 2006, the plan was introduced to Council in January 2007. The Plan Commission referred final implementation until there was an opportunity to refine transportation issues, and to reconcile differences among this plan and the draft Tenney-Lapham Neighborhood Plan, and the East Rail Corridor Plan.

Following the referral, a Plan Commission Sub-Committee was appointed to work on these issues. In January 2008 the Sub-Committee made its recommendation to the full Plan Commission, which adopted the recommendations and forwarded to Council for adoption. The adopting Resolution of Council is included as Appendix 5. All of the recommendations from the Plan Commission Sub-Committee and Council are included in this final plan.

This resulting Plan includes four Core Development Principles and recommendations for the various techniques needed to achieve them including land uses, bulk standards, design guidelines, and transportation and parking considerations. In addition, this Plan also contains several recommended implementation activities to bring the plan to fruition, including some that address recently created Tax Increment Financing District #36 that covers much of the study area.
PROJECT CONTEXT
EAST WASHINGTON AVENUE CAPITOL GATEWAY CORRIDOR

RELATIONSHIP TO URBAN DESIGN DISTRICT #8
A key implementation mechanism of this Plan is the formation of Urban Design District #8 covering the entire study area. The standards for the Design District were developed simultaneously with this Plan and are intended to further the four Core Development Principles by further refining the recommended techniques. Accordingly, this Plan provides a foundation for the standards in the Urban Design District ordinance. It establishes the goals and objectives for the study area and documents the context to be considered by new development and redevelopment projects. It is the intention of the City of Madison that this Plan be a “living document” and that it be referred to in the consideration of proposed new development and redevelopment projects. Accordingly, developers, property owners, business owners, neighborhood residents and their associations are all encouraged to become fully familiar with the Plan because all proposed development projects will be evaluated against its recommendations as well as the more detailed Urban Design District standards.

STUDY AREA
Located in the heart of the East Isthmus, portions of the East Washington Avenue Corridor have been the subject of numerous planning efforts. While those plans provide vital context and important recommendations, this BUILD planning project is the only effort to date that attempts to look at the Corridor as a unique, singular entity and its importance to the Isthmus, City and region. The boundaries of the more significant/recent planning efforts are shown on Figure 1.
EXISTING CONDITIONS

The East Washington Avenue Corridor is the primary transportation spine and eastern gateway into the city of Madison, and plays a prominent role in the economic and cultural life of the city. The Corridor is bounded by East Mifflin and East Main Streets on the north and south, and First and Blair Streets to the east and west. The Corridor’s location between the Dane County Regional Airport and the State Capitol positions it at the confluence of the city’s activities and future redevelopment potential.

In addition to the importance of the Capitol, there are a number of other factors that shape the context of the Corridor, the most significant of which are reflected in Figure 2.

LAND USE AND DEVELOPMENT SCALE

The existing land use and transportation patterns reflect the predominant historic patterns of rail-connected industries in the area generally between East Washington Avenue and Wilson Street. To the north, primarily commercial uses line East Washington Avenue and residential land uses become prominent beyond this area within a block or two of the Avenue. To the south, commercial and industrial uses are dominant as deep as Williamson Street where residential uses begin. In fact, the study Corridor is actually at the northern edge of the commercial and industrial heart of the East Isthmus. The predominant land uses and their relationship to East Washington Avenue, therefore, differ between the north and south sides of the Avenue.

The Corridor and East Isthmus currently have very little visual effect on the overall skyline of Madison (beyond the existing MG&E power plant). Aside from occasional taller structures, the area is dominated by low structures and large areas of parking and storage. However, the Corridor provides the opportunity for outstanding views to both Lakes Mendota and Monona from taller buildings.

STREET NETWORK

The street network is comprised of a hierarchy of street types:

1. East Washington Avenue is also U.S. Highway 151, the central spine of the East Isthmus and the primary entryway into the city of Madison from the east. This is considered to be the “Gateway to the Capitol” and highly symbolic to the city and state.

2. Blair and North First Streets are arterial roadways, marking the western and eastern termini of the study area. Portions of these streets are also designated as U.S. Highway 151 and State Highway 113, respectively.

3. Paterson, Ingersoll, and Baldwin Streets are collector or minor arterial streets that cross East Washington Avenue. These streets provide critical north-south connections to important retail and community gathering centers along Williamson and East Johnson Streets.

4. East Main and East Mifflin Streets run parallel to East Washington Avenue. East Mifflin Street is primarily a residential street while East Main Street is heavily commercial and industrial with limited traffic that relates mostly to those uses located directly on it.

5. The remaining streets are secondary streets currently carrying light vehicular and pedestrian traffic.

OTHER TRANSPORTATION CONNECTIONS

A confluence of railroad lines occurs within the Corridor and will likely affect development densities and land uses in the East Isthmus. Scenarios include plans for regional commuter rail, light rail, or a local trolley system. The rail system is important as a transportation asset, a potential orientation for redevelopment, a noise source, and as a barrier to circulation.

The Capital City Trail passes near the Corridor. It is a recreational and commuter asset that adds value to the area’s location and influences the uses and urban design recommendations.

SURROUNDING DEVELOPMENT PATTERNS

Although land use and transportation play an important role in the redevelopment of this Corridor, there are place-specific “edges” that also will shape development. These edges, shown in Figure 2, are primary parameters that define logical boundaries, create a likely redevelopment area, and determine the variety, size and shape of future redevelopment sites.

These edges include:

- Well-defined residential edges along the north and southeast.
- Important public and quasi-public institutions, including Burr Jones Field, Breese Stevens Field, Reynolds Field, Lapham School, and the MG&E campus.
- The Yahara River Parkway.
- Commercial and industrial buildings along most of the south edge of the Corridor.

Surrounding, building scale includes a variety of heights and massing, ranging from small two-story homes, mostly to the north, to moderate-sized office buildings, to larger footprint industrial and commercial buildings, mostly to the south.
The City and State both have existing Capitol view protection requirements that restrict building height within a one-mile radius of the Capitol Building to heights no greater than the base of the Capitol dome columns (1032 feet above AMSL, or about 180 feet above the ground in most of the affected portion of the study area). This limitation applies to sites between the Capitol Building and Ingersoll Street. In addition, the Federal Aviation Administration regulates height around the airspace of the Dane County Regional Airport. This limitation applies to the entire Corridor and restricts building heights to no greater than 1009 feet above median sea level, or approximately 160 feet at the center of study area.

The view of the Capitol from East Washington Avenue also is of utmost importance. The Capitol comes into view just east of First Street. Although development will never directly block the view of the Capitol base and rotunda, as has occurred along John Nolen Drive, redevelopment fronting East Washington Avenue will affect the “framing” of the Capitol view.

**Parks and Open Space**

Parks and open spaces are urban amenities that in the East Washington Avenue Corridor will be preserved and will likely influence redevelopment patterns and densities. As shown on Figure 2, these park and open space amenities include:
- Yahara River Parkway
- Burr Jones Field
- Breese Stevens Field
- Reynolds Field
- Capital City Bike Trail
- The proposed “Central Park”

**Cultural Resources & Public Infrastructure**

The location, size, character, and pattern of existing cultural resources and public infrastructure also will influence urban design recommendations. As shown on Figure 2, these include historic landmarks, locally significant facilities and places, and public infrastructure. These resources include:
- Madison Historic Landmarks and contributing structures
- Lapham Elementary School
- MG&E campus and power plant
- State Capitol power plant
- Johnson Street commercial area
- Williamson Street corridor
- Electrical power lines along East Main Street
- Excellent infrastructure, especially redundant power and fiber optic lines
- Madison Metro Transit main offices and garage

On Figure 2, “Madison Landmarks” are those buildings that are of historical merit and are already designated as a local landmark by the City Landmarks Commission. Those buildings classified as “Nominated or Eligible Madison Landmark” are those that are of sufficient historical merit to be designated a local landmark. Those shown as “Some Historic Interest” are buildings not of sufficient historical significance to be designated as a local landmark, but which contribute to the historic character of the Corridor.
On March 30, 2005, a meeting was held at Lapham School to determine the public’s goals and desires for the Corridor and to determine the issues of importance to them. Following a brief presentation of past planning efforts on the Isthmus, members of the public were asked to identify Key Values for the study to focus on in the areas of Corridor Function, Transportation/Accessibility, Building and Site Design, Land Use, and Business Development. Figure 3 provides a summarized list of the Key Values identified by the public that evening.

**Summary of Initial Survey of Key Values by the Steering Committee**

**Character of Development**
1. Fully utilize infrastructure/reduce urban sprawl
2. Provide vibrant mix of businesses
3. Protect neighborhood character
4. Enhance recreation open space
5. Create live-work environment

**Identity**
6. Preserve and enhance attractiveness of area to the “new, creative workforce”

**Building Facades & Architecture**
7. Create a dynamic skyline
8. Encourage high-quality development that is visually compatible with architectural context
9. Enhance pedestrian experiences through architectural design

**Streetscapes**
10. Create pedestrian-scale environments and public spaces
11. Encourage visible building activity
12. Bury overhead utility wires
13. Encourage and support public art
14. Encourage energy-efficient and low-glare outdoor lighting
15. Emphasize grand entranceway.

**Neighborhood Character, Compatibility & Context**
16. Ensure compatibility along Corridor with adjacent neighborhoods.
17. Ensure development adjacent to public areas has attractive facades and bicycle and pedestrian connections.

**Employment**
18. Retain and attract high wage employment
19. Retain and attract businesses that provide meaningful employment to Isthmus residents

**Types of Businesses**
20. Provide incubator space
21. Provide post-incubator space
22. Attract light industrial and office businesses
23. Focus business development on job creation, family-supporting wages, and neighborhood-based businesses

**Transportation**
24. Coordinate transportation options and land use
25. Establish an efficient and safe transportation corridor

**Trucks**
26. Respect US-151 as a regional commuter artery

**Parking**
27. Provide (public and private) parking for businesses
A profile of those living on the East Isthmus (bounded by Lake Mendota to the north, Lake Monona to the south, North First Street to the east, and Blair Street to the west) finds the area has:

- **A higher share of young, single persons.** Whereas almost half of Madison’s households have children, only 28% of the households in the East Isthmus do. The median age within the East Isthmus is 29.7 and 31.3 for the City as a whole.

- **A highly educated workforce.** Over 64% of the residents (aged 25+) of the East Isthmus have either a Bachelor’s Degree or higher. For the City, this figure is just over 48%.

- **Slightly less diverse than the rest of the City, with an expected increase in diversity over time.** Although 86% of the residents in the East Isthmus are white, as compared to 82% for the City, the overall ethnic diversity is expected to increase in the next five years.

- **A commitment to alternative travel modes to work.** Only about 53% of the East Isthmus residents reported traveling to work alone in their car, as compared to 66% for the City of Madison.

- **A higher percentage of rental housing.** Over 68% of occupied housing units were rentals, as compared to 50% rental in the City of Madison.

- **Slightly more affordable rents.** Those rental units were slightly more affordable, however, than the City as a whole, with the average rents of $616 per month, compared to $629 for the City of Madison.
MARKET CONDITIONS

Below are brief summaries of the key findings indicated by the market data. However, the data and these summaries are intended only to understand past market trends and are not intended to be used exclusively to predict future market conditions. In fact, some project Steering Committee members took exception to the data and some of the conclusions discussed in the meetings. Past and current market conditions aside, it is critical to bear in mind that the scope of redevelopment potential in this Corridor is vast. Accordingly, future redevelopment projects, and the new residents and employees they will bring with them, can and will significantly influence future market trends and buying patterns.

EMPLOYMENT

According to 2000 Census data, the Services and Government industries are the top employers in the study Corridor, with 489 (30%) and 348 (21.4%) employees, respectively. Major employers in the Corridor (shown on Figure 5) include Madison Gas and Electric (MG&E), Metro Transit, and Research Products.

COMMERCIAL SUPPLY AND DEMAND

In market terms, “leakage” occurs where people leave an area to obtain certain goods and services. In other words, the residents’ needs are not being met in the immediate vicinity causing them to shop elsewhere. On the East Isthmus, industry segments that experience more than 90% leakage and have a potential retail demand of 5% million or more in expected consumer expenditures are shown in Figure 6. There are a number of factors that influence the potential success for new business at both locations beyond immediate proximity to the customer base, but opportunities may exist in the Corridor within these segments, particularly as the customer base grows as a result of new residential development.

The East Isthmus also has a surplus of certain industry segments, meaning that there are more businesses in the area than there are customers in the area to support them. These businesses tend to draw people into the area from outlying areas. Industry segments on the East Isthmus that have a 20% surplus, or 20% more supply than consumer demand within the immediate area, are shown in Figure 6. For some businesses, like restaurants and taverns, a clustering of several establishments can be very positive and actually create additional market for yet more of these businesses even though the data may suggest an area is already “over-served”. For other business types, new ventures may be much more difficult to get off the ground in areas that already have a great deal of competition. Accordingly, the importance of under- and over-represented businesses is dependent on the specific type of use and several other factors that are beyond the scope of this Plan. Nonetheless, the information provided here is helpful in understanding the current mix and “balance” of businesses within the East Isthmus.

Under-represented Commercial Businesses
- Furniture Stores
- Non-store Retailers
- Shoe Stores
- General Merchandise Stores
- Department Stores
- Other General Merchandise Stores
- Electronic Shopping and Mail-Order Houses

Over-represented Commercial Businesses
- Used Merchandise Stores
- Miscellaneous Store Retailers
- Full-Service Restaurants
- Sporting Goods/ Hobby/ Musical Instrument Stores
- Special Food Services
- Food Services & Drinking Places
- Drinking Places (Alcoholic Beverages)
- Automobile Dealers
- Beer, Wine, and Liquor Stores
- Motor Vehicle & Parts Dealers

Source: ESRI BIS, 2005
Grubb & Ellis/Oakbrook annually produces Office Market Trends Madison, the most current being published in early 2005 (although vacancy rates for 2005 have been provided for this Plan by the report’s author in advance of publication of the 2006 report). Figure 7 provides vacancy rates by class of space over the last several years. In 2004, office vacancy rates in Madison declined overall due to a solid decrease (4.9%) in Class A office space and despite slight increases in Class B and Class C vacancies. Due to a four-year low in construction of new space, the absorption of space in 2004 actually exceeded the completion of new space. According to the report, given the lowered vacancies for Class A space and fewer new projects under construction, development proposals for new Class A space are expected to increase.

The area within the Corridor is split between the report’s Downtown and East side office markets, with the dividing line being Paterson Street. Figure 8 provides vacancies for all of Madison, the Downtown and East side for all types of office space (Class A, B and C). According to the report, Downtown vacancies were primarily affected by the State’s continued efforts to cut employment, which also has led to a decrease in asking rents for existing space. East side vacancies, on the other hand, are down, although the overall vacancy rate remains high at 18.2%. In conversation with the primary author of the study, Christian D. Caulum, much of the vacancy in the East side market, particularly for Class C space, lies within the Corridor. However, the larger, vacant office buildings in the Corridor could be upgraded to Class A or Class B space, which, as noted above, does appear to have increasing market interest.

**Marketing & Branding**

The Corridor has several significant assets that will help attract creative and innovative employers such as direct proximity to: the Capitol and state offices; the University of Wisconsin campus; the Overture Center; Downtown employers; a highly skilled and educated work force; lake views; and historic buildings. However, the Corridor also has several perceived disadvantages, such as: a lack of land; high land costs; and lack of parking. As indicated by the market data for commercial and office space, there is potential for increased business growth, but there is also a lot of competition within Madison and Dane County. Working in the Corridor’s favor, though, is the ongoing conversion of underutilized commercial and low-scale residential parcels in the Downtown to high-rise condominiums. The is having the effect of pushing the need for new office space of all types toward the East Isthmus, particularly for those businesses and non-profits needing ready access to City, County and State offices.

Currently, the “market” has difficulty seeing the significant employment growth potential and locational advantages offered by the Corridor. Although recent, large-scale development proposals have helped increase interest in the area, the Corridor will need to be actively marketed and “branded” in order to realize its full potential. In addition, the City will need to make full and creative use of the newly established TIF District #36 to overcome some of the economic disadvantages faced by redevelopment within the Corridor.
REGIONAL POSITION

The role of the Corridor within the city of Madison and the larger region was another important consideration in determining the Corridor’s future development potential (See Figures 9, 10 & 11). The East Rail Corridor Plan, completed in 2004, made strong recommendations for bolstering employment uses. The Corridor’s urban location and connections to other major activity/economic centers makes it particularly well-suited to innovative and creative industries, including the arts, as well as those businesses and non-profits needing proximity to the Capitol (see Figure 12).

POTENTIAL EMPLOYMENT GENERATING USES

The Corridor is very different from the majority of other regional office employment centers, most of which are located outside of central Madison. These include the west and east edges of the City and the suburbs, such as Fitchburg, Verona and Middleton. The East Washington Avenue Corridor presents a significant opportunity to build employment in the heart of Madison, near transit and where many people want to live. The importance of keeping jobs within the central city cannot be overstated: when people live closer to where they work, there is less stress on local and regional roadway systems and greater potential to support other modes of transportation, such as transit, walking and bicycling. In addition, employment growth is essential to creating and maintaining a healthy central city as residential development continues to flourish and densities increase. By promoting additional employment options on the East Isthmus, the City of Madison can provide a sound balance of employment and residential uses, with the East Washington Avenue Corridor uniquely positioned for employment growth given its many locational advantages and the highly educated and tech-savvy workforce in the adjacent neighborhoods.

Employment uses with the most potential in the Corridor include:

- Urban Start-ups/Accelerator Spaces - providing affordable and flexible work spaces for small, technology-related entrepreneurs, such as recent graduates of the University, who have little capital to invest in buildings and ever-changing space needs.
- Design/Creative Center and Related Uses - providing creative/off-beat spaces for a variety design professionals who prefer to co-locate with allied businesses to foster a synergistic and vibrant work environment, many of whom are already located on the East Isthmus.
- Food-related Businesses - those that focus on the emerging regional and “slow foods” movements that emphasize family-owned farms, locally grown products, organic produce, gourmet and hand-crafted foods, and related food processing.
- Wisconsin Gateway/Showcase - businesses needing direct proximity to the Capitol and state administrative offices, such as trade organizations, and corporations with significant operations elsewhere in Wisconsin or the U.S. needing a presence at the state Capitol.

Regional Employment Center.

Potential Employment-Generating Uses

**URBAN START-UPS/ACCELERATOR SPACE**
- Information Technology
- Software design
- Biotechnology
- University Research Tech Campus

**FOOD-RELATED BUSINESSES**
- Public/indoor market
- Community Supported Agriculture (CSA) distribution site
- Food resource/education/training center
- State marketplace center
- Small-scale processing
- Incubator space

**DESIGN/CREATIVE CENTER AND RELATED USES**
- Design firms
- Communications
- Arts studios/galleries
- Media
- Advertising

**WISCONSIN GATEWAY SHOWCASE**
- State trade association office space
- State/Madison presence of national and Wisconsin-based companies
- Satellite office for Milwaukee-based companies
- Non-profit office space
- State marketplace to sell Wisconsin related merchandise
- Financial institutions
EAST WASHINGTON AVENUE CORRIDOR PLAN
CORE DEVELOPMENT PRINCIPLE

After careful consideration of all of the background information, including numerous meetings on the Key Values and the forces shaping the Corridor, the Steering Committee crafted four Core Development Principles and a series of techniques to be implemented for achieving them. The following four, equally-important Core Development Principles reflect the most significant goals to be achieved within the East Washington Avenue Corridor and with which all proposed development projects must comply. Under each Core Principle are a series of recommended techniques that should be employed to achieve the particular goal.

I. PROTECT AND ENHANCE THE ICONIC VIEW OF THE CAPITOL

Bulk Standards
1. Incorporate building setbacks and stepbacks to protect the view of the Capitol.
2. Incorporate minimum and maximum heights for buildings that directly front along East Washington Avenue that may then step up or down away from the Avenue.
3. Incorporate building setbacks and stepbacks to frame views of the Capitol in a complementary fashion from one side of East Washington Avenue to the other.
4. Incorporate varied building setbacks and varied roof designs within permissible height limits to avoid a walling/canyon effect of the Capitol view corridor and the plateau effect of flat and uniform building tops.

Design Guidelines
5. Incorporate building designs, materials, and exterior colors that complement surrounding development and do not attract attention to the detriment of the view of the Capitol.

II. RESPECT AND STRENGTHEN EXISTING NEIGHBORHOODS

Land Uses
1. Provide a mix of housing types that, together with the existing housing stock of the adjoining neighborhoods, provides a wide range of housing options within the Corridor.
2. Provide a mix of commercial uses that serve the needs of the adjoining neighborhoods and other development within the Corridor that are complementary with the existing commercial uses and districts located north and south of the Corridor.

Bulk Standards
3. Where adjacent to existing residential uses, adopt height limits and building setbacks and stepbacks to provide a compatible street level scale and adequate solar access.

Design Guidelines
4. Where adjacent to existing residential uses, incorporate building designs, materials and colors that are consistent with the existing residential environment.

III. FIRMLY ESTABLISH THE CORRIDOR AS AN EMPLOYMENT CENTER SUPPORTED BY TRANSIT

Land Uses
1. Permit a broad range of employment land uses, especially on the south side of East Washington Avenue.
2. Permit a mix of integrated uses within areas designated as employment to support the needs of employees and employers (such as small-scale retail, personal and business services, and, possibly, limited residential or live-work spaces) - discourage free-standing commercial and residential development in these areas.
3. Encourage development of housing where identified as appropriate on the north side of East Washington Avenue that would be attractive to employees on the south side to increase live-work options.

Bulk Standards
4. Permit intensive development of parcels identified for employment including a high percentage of lot coverage, high floor area ratios, and multiple stories as an off-set to high land costs and to maximize existing infrastructure investments.

Business Development
5. Work with existing businesses to determine future plans and needs so they can grow and prosper in their current location.
6. Work with existing property owners to develop a complete inventory of available space, lease rates, and build-to-suit opportunities.
7. Develop marketing materials and a marketing strategy to actively promote the Corridor to new and expanded businesses.

Transportation and Parking
8. Recognize East Washington Avenue’s designation as the primary auto and truck route into downtown to and from the east, and ensure that development patterns do not inadvertently direct through traffic to other east-west streets on the Isthmus.
9. Use TIF funds and other revenue sources to provide parking, transit, and related public amenities needed to attract new employers to the Corridor.
10. Provide incentives for employers/employees to use transit and modes of transportation other than automobiles.
11. Develop additional transit options including commuter rail and/or streetcars.
12. Use TIF and other programs to encourage the building of shared parking facilities consistent with new development.
13. Widen sidewalks and add streetscape amenities to encourage pedestrian activity along East Main Street.
14. Recognize that mobility is the key to area’s redevelopment and encourage a full range of transportation options to move people, goods, and services within and through the Corridor.

IV CREATE AN INVITING, VIBRANT BOULEVARD ALONG EAST WASHINGTON AVENUE

Land Use
1. Promote a mix of active ground floor uses consistent with the land use plan.

Bulk Standards
2. Establish uniform minimum and maximum heights for buildings fronting directly on East Washington Avenue that may then step up or down away from the Avenue.

Transportation and Parking
14. Prohibit new surface parking lots and other service areas fronting along East Washington Avenue as redevelopment occurs.
15. Incorporate transit amenities, such as shelters, at regular intervals along the Corridor.
Figure 13 indicates the implementation techniques that are particularly important for realizing each Core Development Principle. These are defined in greater detail in the following sections of this chapter.

LAND USE

Future land uses provide the foundation on which all other aspects of the Corridor are built. In addition to the Core Development Principles, other factors influencing these recommendations are existing land uses, surrounding uses, and uses called for in past planning efforts. The recommended Future Land Use Plan contained on Figure 15 seeks to maintain consistency with the neighborhoods and long-standing uses that adjoin the Corridor, while also seeking to maximize the opportunity for a regional employment center as envisioned in the East Rail Corridor Plan and Isthmus 2020 Plan.

FUTURE LAND USE DISTRICTS

The future land use districts summarized in Figure 14 are those defined in the City of Madison Comprehensive Plan, and the Future Land Use Map shown in Figure 15 is generally consistent with the Generalized Future Land Use Plan contained in the City’s Comprehensive Plan. Please consult the City’s Comprehensive Plan (2006) for a further description of these districts.

CITY OF MADISON COMPREHENSIVE PLAN (2006) FUTURE LAND USE DISTRICTS

Medium-Density Residential: Medium-Density Residential Districts are locations recommended primarily for relatively dense multi-family housing types, such as larger apartment buildings and apartment complexes. The Medium-Density designation is also applied to portions of some established neighborhoods that are composed primarily of “houselike” residential buildings, although there may also be a scattering of apartment buildings. In these areas, the Medium-Density designation reflects the large number of houses that were originally built as multi-unit, duplex, two-flat, or three-flat structures, or have subsequently been converted to contain several dwelling units. In these situations, it is recommended that these areas continue to maintain the “house-like” character, and the designation is not intended to encourage further conversion or replacement of existing housing with apartment-style buildings, except as may be specially recommended in an adopted neighborhood or special area plan. Note that there may be little outward visible difference between portions of these mixed-housing-type neighborhoods designated as Medium-Density and those portions designated Low-Density.

Community Mixed-Uses: Community Mixed-Use areas should be located adjacent to Medium- and High-Density Residential areas whenever possible. As an alternative when adjacent to Low Density residential areas, the Mixed-Use district should be large enough to include a significant amount of relatively high-density housing within the defined district. Community Mixed-Use districts should also be located along existing or planned high-capacity public transit routes, and a transit stop should be located at, or very close to, all activity center focal points within the district. Because of their location along transportation corridors, it is recommended that many of the city’s aging strip commercial centers and suburban-style shopping centers be considered for eventual redevelopment as Mixed-Use districts.

Employment: Employment districts (as distinct from Commercial districts) are recommended as predominately office, research and specialized employment areas and generally do not include retail and consumer service uses serving the wider community. Limited retail and service establishments primarily serving employees and users of the district are encouraged. Although primarily used to identify relatively large, multi-establishment employment districts, such as the University of Wisconsin Research Park, the designation may also be applied to an individual property, such as a hospital, for example.

EAST WASHINGTON AVENUE CORRIDOR PLAN REFINED FUTURE LAND USE DISTRICTS

Building from the generalized future land use districts in the City’s Comprehensive Plan, this Corridor Plan suggests the following more refined mix of uses:

- **Employment**: Principal uses that are consistent with the Comprehensive Plan definition of Employment.
- **Commercial**: Primarily retail users, such as those that serve the adjoining neighborhoods and businesses, as well as smaller destination users, that are compatible with residential uses in a mixed-use district.
- **Residential**: All housing, including a variety of density, ownership, and mix (including live-work units), which can also serve to buffer the adjoining neighborhoods from the more intensive non-residential uses within the Corridor.
- **Park**: Public parks and open space, including Breese Stevens Field, Burr Jones Park and the Yahara River Parkway
- **Mixed-Use**: The solid color represents the intended primary use and the stripe color indicates the secondary use. Uses may be separated vertically and/or horizontally.

Possible locations for shared parking facilities as described in the Transportation and Parking sub-section of this chapter.

FUTURE LAND USE
EAST WASHINGTON AVENUE CAPITOL GATEWAY CORRIDOR
BULK STANDARDS

Once the land use is established, the character, look and feel of the Corridor will be shaped by the Bulk Standards to be applied to new development projects. These include building setbacks (distance from the front property line), street level facade heights (heights of lower floors located at the setback line), stepbacks (upper floor “indents” above the lower facades), and maximum building heights.

SETBACKS AND STEPBACKS

Along with street level facade heights, building setbacks directly affect the look and feel of the Corridor from the perspective of pedestrians. Figure 16 provides a list of setbacks throughout the Corridor.

Figure 16 also provides a list of building stepbacks. These are the minimum distances that portions of buildings that are taller than the street level facade heights must be stepped back from the facade wall to create a discernable difference in the elevation to achieve the desired scale at the pedestrian level and, where an angle is specified, to minimize the effect of taller buildings on smaller-scale development located across the street. An additional benefit of building stepbacks is the disruption of high wind speeds that rush down the faces of tall buildings before they reach the sidewalk.

STREET LEVEL FACADE HEIGHTS

Street level facade heights have a significant effect on the character of the Corridor from the perspective of pedestrians and motorists. Lower building heights at the setback lines help keep pedestrians from feeling overwhelmed by taller buildings, and consistent street level facade heights help to frame the view of the Capitol looking down the Corridor. The street level facade heights shown on Figure 17 provide the minimum and maximum range of heights at the setback lines. Portions of buildings that exceed these heights must provide a stepback as described above.

*15' stepback only E. Main, Dickinson to Northern Ct.
Maximum building heights will have a more profound effect on the intensity of development and character of the Corridor than perhaps any other bulk standard. However, previous plan recommendations need to be considered as well as local, state, and federal regulations. Applicable regulations include the Capitol View Preservation standards, contained in both City and State regulations, and the Federal Aviation Administration (FAA) Airport Approach Protection standards for flight path clearances around the Dane County Regional Airport (located to the northeast of the Corridor). The Capitol View Preservation standards apply within the Corridor from Blair to Ingersoll and the FAA standards cover the entire Corridor. Recommendations in the recently completed East Rail Corridor Plan also covered building heights on the south side of East Washington Avenue.

Recommended building heights along the Corridor are shown on Figure 18. Height is provided in stories, based on average story heights of 9 to 12 feet (15 feet for ground floors). Buildings with greater floor heights should have fewer stories accordingly. Where a maximum of 15 stories is indicated, the maximum height is intended to be less than or equal to the Capitol View Preservation limit (1032 feet above AMSL or about 180 feet above the ground), and only then if the appropriate variance is granted by the FAA to exceed its maximum recommended height (1009 feet AMSL or about 160 feet above the ground). In general, heights in the Corridor above the FAA limit are discouraged.

**Maximum Building Heights**

**Recommended Maximum Heights**

- Maximum building heights will have a more profound effect on the intensity of development and character of the Corridor than perhaps any other bulk standard.
- Previous plan recommendations need to be considered as well as local, state, and federal regulations.
- Applicable regulations include the Capitol View Preservation standards, contained in both City and State regulations, and the Federal Aviation Administration (FAA) Airport Approach Protection standards for flight path clearances around the Dane County Regional Airport.
- The Capitol View Preservation standards apply within the Corridor from Blair to Ingersoll and the FAA standards cover the entire Corridor.
- Recommendations in the recently completed East Rail Corridor Plan also covered building heights on the south side of East Washington Avenue.
- Recommended building heights along the Corridor are shown on Figure 18. Height is provided in stories, based on average story heights of 9 to 12 feet (15 feet for ground floors).
- Buildings with greater floor heights should have fewer stories accordingly. Where a maximum of 15 stories is indicated, the maximum height is intended to be less than or equal to the Capitol View Preservation limit (1032 feet above AMSL or about 180 feet above the ground), and only then if the appropriate variance is granted by the FAA to exceed its maximum recommended height (1009 feet AMSL or about 160 feet above the ground). In general, heights in the Corridor above the FAA limit are discouraged.

![Figure 18](image-url)
Figure 19 presents the Capitol View Preservation height limits, the FAA height limits, and the recommendations of the East Rail Corridor plan for the south side of East Washington Avenue within the study area. Figures 20 and 21 include the maximum building height limits recommended in this Plan for the north and south sides of East Washington Avenue.

Please note in Figures 20 and 21, this represents the maximum height, in stories, allowed without requiring bonuses. Consideration of bonuses would be dependent on provision of amenities as described in Plan Commission Committtee Capitol Gateway Corridor Plan Minutes of December 10, 2007. Maximum heights with bonuses are 15 for 12*, 10 for 8* and 8 for 6*.

It is important to remember that the recommended maximum heights shown in are intended only to establish an "envelope" for development. Within this envelope, properties and blocks are expected to have varying footprints and towers that result in a skyline with a series of buildings and open spaces as shown on Figure 22.
Figure 23 indicates the locations of the seven profile cross sections shown in Figure 24. These cross sections reflect all of the bulk standards discussed above for each location.

Please note in Figure 24, this represents the maximum height, in stories, allowed without requiring bonuses. Consideration of bonuses would be dependent on provision of amenities as described in Plan Commission Committee Capitol Gateway Corridor Plan Minutes of December 10, 2007. Maximum heights with bonuses are 15 for 12*, 10 for 8* and 8 for 6*.
In addition to controlling the sheer mass of buildings, the bulk standards directly affect critical, character-defining elements of the Corridor. These include: areas for street-level activities like outdoor plazas and dining areas (setbacks); framing the view to the Capitol (setbacks and street level facade heights); and sunlight and shadows (setbacks and maximum building height). While the profile cross sections shown in Figure 24 are helpful in understanding the minimum and maximum limits placed on future development, actual building projects will not have simple, block geometry. Upon the adoption of this Plan by the Common Council, the City is developing standards for Urban Design Districts. The Urban Design District ordinance contains more detailed bulk standards and building design guidelines to ensure that all structures will be of high quality and will contribute to an overall positive appearance and desired character of the Corridor as reflected in Figures 25, 26 and 27.

DESIGN GUIDELINES

Together with the bulk standards, the design guidelines included in this Plan (to be further refined in the Urban Design District #8 standards) help ensure that development is sensitive to the “context” of the surrounding area. The context includes the land uses, sizes and types of structures, public open spaces, and transportation facilities, among other elements, that developers must take into account when planning their projects. For purposes of identifying the existing context, guidelines are provided for the primary streets (East Washington Avenue, East Main Street, and East Mifflin Street) and the Yahara River Parkway. In addition, the Corridor has been segmented into five distinct areas with each having a unique set of recommendations.

PRIMARY STREETS AND PARKWAYS

The streets and parkways are the public rooms of the Corridor. It is important to acknowledge and in some ways preserve the existing character and land use patterns in these public rooms. The public spaces of East Mifflin Street and East Washington Avenue will be preserved as well as improved, while East Main Street will be re-introduced to the community as a more prominent and important street in the Corridor (See Figure 28).

EAST WASHINGTON AVENUE

The character of East Washington Avenue should be formal and uniform in signage, streetscape, building orientation, setbacks, and street level facade heights, as defined by the recommended bulk standards; yet at the same time, present an interesting, vibrant character with variety, activity and urban amenities (See Figure 29). The scale and amount of building face block enclosure should vary along the Avenue along with the experience. The streetscape, however, should always frame the Capitol view.

Beyond aesthetic improvements, East Washington Avenue should be the showcase of Wisconsin as Madison’s front door to employment and industry. The Avenue is a major thoroughfare that should remain auto-oriented, yet also provide connections for pedestrian and transit use and areas for outdoor gathering and activity. Key intersections at Paterson, Brearly, and Ingersoll Streets should have active urban open spaces where pedestrians and transit riders provide an active presence to the streets.
EAST WASHINGTON AVENUE BUILD

23
CAPITOL GATEWAY CORRIDOR PLAN

EAST MAIN STREET

Blair to Ingersoll Streets - This is a working street dominated by utilities, industrial functions, and parking lots while being the entry and access to many small and established businesses. However, the Corridor should become more pedestrian friendly as a strong link to downtown and retain its cluster of historic industrial brick buildings. East Main Street facades should include pedestrian entries, but large, intensive parking and loading areas should be concealed with access directed to the north-south side streets, where possible.

Dickinson Street to the Yahara River - This segment has a mix of vacant buildings, industrial businesses, parking lots, and new residential development. While the area is currently underutilized it should be revitalized as an active street with pedestrian improvements and on-street parking serving both the new residential on the south and the reuse of historic buildings on the north. Although non-residential uses are recommended for the north side of the street, larger buildings and more intensive development should be concentrated along the East Washington Avenue frontage and step down toward the East Main Street frontage.

Yahara River to North First Street - This segment has, and should continue to have, a residential character. Traffic should be kept to low volumes and low speed; development/redevelopment on the north side should be concentrated toward East Washington Avenue and away from the existing homes on the south side of East Main Street.

EAST MIFFLIN STREET

Blair to Ingersoll Streets - This segment is characterized by: commercial and light industrial uses; a number of public spaces including Breese Stevens Field, Reynolds Field, and Lapham School; and two block faces of residential uses. Future plans for this area should include a better defined streetscape at a walkable, pedestrian scale with on-street parking. The area should remain mixed use with employment, residential and public uses connected by the existing community spaces.

Ingersoll to Dickinson Streets - This is primarily a single-family residential area with tree-lined streets. This area should remain a residential area with on-street parking and be protected against traffic effects from development along East Washington Avenue.

YAHARA RIVER & THORNTON STREET

The Yahara River frontage and Thornton Street corridor currently contains uses that do not relate to the river or the riverfront. This corridor should become an active, recreation and pedestrian area, characterized by new residential and mixed-use/retail development along the Parkway. New development should be cohesive with the new Yahara River bridge pathways and underpass and should tie into the riverfront. New development should provide adequate setbacks and maintain a low-scale frontage on Thornton to provide solar access along the Parkway. All structures fronting on Bun Jones and the river should have transparent and articulated facades with visible activity and functions that interact with the riverfront.
Five distinct segments have been identified within the Corridor, delineated by the fabric of development, uses, street level activity, and surrounding buildings and activities that may influence redevelopment. Figure 30 provides specific urban design recommendations for addressing the factors influencing redevelopment within each area.

**Segment 1**
This Segment is the district closest to the Capitol. The dominance of the existing MG&E campus on the south side means that most redevelopment will occur on the north side. A symbolic structure placed in the terraced median of East Washington Avenue west of Blair would provide a focal point and should be surrounded by permanent, quality architecture at the intersection of Blair Street and East Washington Avenue in order to set a tone for this gateway to the Capitol.

Factors Potentially Influencing Redevelopment:  
- Existing utility, office, and commercial uses  
- Prominence of Blair Street and East Washington Avenue intersection  
- Proximity to the Capitol  
- Proximity to MG&E and State Capitol power plants  
- Adjacent to City Market and Das Kronenberg Condominiums  
- Adjacent to new medium-density residential

**Segment 2**
This Segment contains the tallest proposed buildings in the Corridor and important intersections with Paterson and Ingersoll Streets. This should be an increasingly active employment center where people arrive by bus, rail, bike, car, and foot to work in taller, urban-scale buildings that offer magnificent views to the city, surrounding lakes and Breese Stevens Field. The buildings in Segment 2 could surround courtyards filled with employees who utilize these active public spaces for meetings and social gatherings. Across the street from the employment centers, active multi-story residential buildings and walkup townhomes would sustain a high level of activity after business hours.

Factors Potentially Influencing Redevelopment:  
- Existing utility, office, and commercial uses  
- Prominence of Blair Street and East Washington Avenue intersection  
- Proximity to the Capitol  
- Proximity to MG&E and State Capitol power plants  
- Adjacent to City Market and Das Kronenberg Condominiums  
- Adjacent to new medium-density residential

**Segment 3**
Segment 3 is characterized by the predominance of the Marquip campus and Metro Transit. Enhancements on the south side of East Washington Avenue should frame the Capitol building and shape the facade of Marquip as it becomes active with new businesses. Across the street, a vibrant, small-scale mixed-use commercial development could serve the upstairs residents of the development and the adjacent neighborhood. Pedestrian nodes at Ingersoll and Baldwin Streets would allow cross-Corridor connections.

Factors Potentially Influencing Redevelopment:  
- Existing office, commercial, industrial, and residential uses  
- Large existing commercial/industrial facilities (e.g., Marquip and Metro Transit)  
- Activity at Baldwin and Ingersoll Street intersections  
- Proximity of single-family residential neighborhood to East Washington Avenue  
- Proximity to rail and proposed Central Park  
- Shallow redevelopment sites and alley on the north side of East Washington Avenue

**Segment 4**
This Segment serves as the nexus of rail, bus, bike, boat, and auto transportation in the Corridor. The Segment presents the opportunity for riverfront office, residential, and commercial development with a master planned project along the riverfront on both sides of East Washington Avenue. Development near the river could allow activities to spill over to the river and recreational areas. Residents and workers in the surrounding buildings could lunch along the river and rent canoes from a local business in the Segment.

Factors Potentially Influencing Redevelopment:  
- Existing office, commercial, industrial uses  
- Borders the Yahara River Parkway  
- Activity at Baldwin Street intersection  
- Adjacent to new Yahara riverfront residential on East Main Street  
- Railroad line passes through area and crosses East Washington Avenue  
- Large contiguous parcels  
- Irregular shaped remnant parcels

**Segment 5**
In Segment 5, the Capitol Building comes into view just over the hill at North First Street when approaching from the east, with the view framed by the new Yahara River bridge. The south side of the Corridor should include employment/mixed-use, with decreasing height to the residential area on East Main Street. On the north side, residential buildings could overlook Burr Jones Field with distant views to the lakes and Capitol, while stepping down toward North First Street and the low-density residential area to the east. Transparent facades would allow visibility of commercial activity along East Washington Avenue. The river in this area should be used for entertainment, residential, commercial, and retail uses, with restaurants and outdoor activities connecting to the river parkway activities and trail.

Factors Potentially Influencing Redevelopment:  
- Existing commercial and residential uses  
- Borders the Yahara River Parkway and Burr Jones Field  
- Importance of North First Street intersection  
- Proximity to City maintenance facilities on North First Street  
- Includes, and adjacent to, existing single-family residential  
- Railroad spur passes through area and crosses East Washington Avenue  
- Large contiguous parcels
**SPECIFIC URBAN DESIGN RECOMMENDATIONS**

**EAST WASHINGTON AVENUE**

**CAPITOL GATEWAY CORRIDOR**

**SEGMENT 1**
- Orient prominent building to corner of East Washington Avenue and Blair St.
- Scale buildings compatibly with Market Place Apartments at Mifflin St. and Blount St.
- Scale buildings compatibly with new residential development on west side of Blair St.
- Coordinate design with potential redevelopment of Reynolds Storage site.
- Scale buildings compatibly with Das Kronenburg residential tower.
- Potential location of shared parking structure.
- Design infill sites compatibly with shallow lots and adjacent historic structures.
- Coordinate new development with MGE Campus Plan.

**SEGMENT 2**
- Preservation of industrial era historic structures.
- Create pedestrian plazas at East Washington Avenue corners (Paterson St. and Ingersoll St.)
- Orient buildings to Breeze Stevens Field.
- Enhance Breeze Stevens Stadium.
- Enhance Stadium Plaza.
- Use historic Kluttner Grocery warehouse (901 East Washington) as architectural precedent for street level building height.
- Scale buildings and orient activity areas compatibly with Lapham School.
- Maintain solar access to Lapham School.
- Scale buildings at frontage compatibility with Main St. scale.
- Orient buildings to respect and take advantage of views to Reynolds Field.

**SEGMENT 3**
- Scale buildings compatibly with Curtis Ct. residential development.
- Scale buildings compatibly with adjacent residential properties.
- Create pedestrian plazas at East Washington Avenue corners (Ingersoll St. and Baldwin St.).
- Enhance landscape terraces at Madison Metro and Marquand facilities.
- Reuse historic Marquand facilities.
- Potential location of shared parking structure.
- Explore potential rail transit-oriented development.

**SEGMENT 4**
- Preserve industrial era historic structures.
- Scale buildings compatibly with adjacent existing and proposed Mifflin St. and Main St. properties.
- Incorporate bike and pedestrian connections to Yahara River.
- Maintain solar access to Yahara Parkway.
- Locate river-oriented master planned development.
- Integrate development in with Yahara Parkway bike and pedestrian circulation.
- Explore potential over/underpass at rail to link master plan development.
- Coordinate circulation with Mifflin St.
- Locate shared parking structure.
- Integrate new development with site access from East Washington Avenue at the Yahara River Bridge.
- Incorporate historic architectural elements from Madison's industrial era.
- Locate public art.

**SEGMENT 5**
- Scale buildings compatibly with existing residential properties.
- Scale buildings compatibly with existing residential properties on north side of First St.
- Integrate new development with new site access from East Washington Avenue at Yahara River Bridge.
- Locate river-oriented master planned development.
- Integrate development with Yahara Parkway bike and pedestrian circulation.
- Utilize site gradient in site, building, and parking design.
- Utilize views of and access to Burr Jones Field as redevelopment asset.
- Explore potential use of rail air rights.

**MAP LEGEND**
- Recreation/Open Space
- Madison Landmark
- Nonprofit or Eligible Madison Landmark
- Rail
CORRIDOR CHARACTER

Figures 31 and 32 are study sketches intended to convey the sense of character desired for the Corridor once the land uses, bulk standards, and design guidelines are applied. Figure 31 provides a perspective from the point of view of a person walking along a typical block on East Washington Avenue.

Figure 31
Figure 32 provides a perspective from the point of view of someone riding in a car along a typical block on East Washington Avenue. Some of the buildings in Figures 31 and 32 are existing, while others are reflective of what could happen. However, the drawings are not intended to be place- or building-specific, but merely illustrative of the desired character and feel of the Corridor.
TRANSPORTATION AND PARKING

A fundamental principle of the Madison Comprehensive Plan is that land use planning and transportation planning must be integrated and work in tandem. This is especially true for the geographically compact area of Madison's Downtown and East Isthmus where the Capitol Gateway Corridor is located. The scale and intensity of development shown in this plan will place significant demands on the existing transportation system, requiring extensive analysis and implementation of alternative modes of transportation. The development potential indicated by the recommended land uses and bulk standards in the plan cannot be achieved without a dramatic decrease in the percentage of employees, residents, and visitors to the area using personal automobiles. In addition, the amount, location and access points for large parking areas need to be carefully planned so as not to conflict with the Core Development Principles and the design and character recommendations in the Plan. The Plan recommends the implementation of strategies and programs to reduce the amount of parking typically required for individual developments along the Capitol Gateway Corridor in order to reduce the land area and building volume which must be devoted to parking and to reduce the demands on the existing transportation system.

Although the long-term development potential along the East Washington Avenue Capitol Gateway Corridor is substantial, the more near-term potential for significant amounts of development lies in the Capitol Gateway Corridor Plan, the East Rail Corridor Plan and adjacent neighborhood plans. The Plan recognizes that the long-range options to provide alternative modes of transportation to serve the Downtown and the Isthmus transcend the East Washington Avenue Capitol Gateway Corridor and must be addressed on a community-wide basis. The Plan, however, also recommends that methods should be used to encourage the use of alternative modes of transportation and to reduce the demand for parking on a project-by-project basis as development occurs. The City should take steps to address both the long-term need to better integrate all transportation modes serving the Isthmus with land use planning and to address transportation demand management and traffic effects on a project-by-project basis.

DOWNTOWN/ISTHmus AREA TRANSPORTATION AND PARKING STUDY/PLAN

In order to manage current and future transportation demand across multiple modes and to integrate the transportation infrastructure and services needed to serve the land use and development recommendations emanating from the City’s adopted plans, the City should commit to the development of a comprehensive multi-modal Isthmus Area Transportation Plan and Parking Strategy. This multi-modal planning initiative should bring together and coordinate the recommendations from the transportation studies recently completed or currently underway including:

1. Transport 2020 Commuter Rail
2. Madison Streetcar Study
3. Platinum Bike Task Force
4. Ad Hoc Long-Range Madison Metro Committee
5. Parking Utility Strategic Plan and Policies
6. Metropolitan Planning Organization 2030 Regional Transportation Plan
7. High Speed Intercity Rail

Figure 33 shows the current possible future transportation services covering the Corridor.

Components or elements of such a study should include:

- Establishing a realistic vision, expectations, and strategy for how people and goods will move to, through, and around the Isthmus in the future (a 2030-2040 planning horizon is recommended).
- Expanding upon, and incorporating into an updated Isthmus Area Transportation Plan, the recommendations of the Madison Comprehensive Plan, the MPO Regional Transportation Plan, and several mode-specific plans currently being prepared.
- Focusing on maximum inter-operability among present and future modes.
- Introducing a fiscal policy perspective to balance investments across all modes.
- Integrating Downtown and Isthmus Transportation Plan recommendations with the various land use recommendations included in adopted plans, including the Comprehensive Plan, Downtown Plan, Corridor Plans, neighborhood plans, and special area plans.

Both the City of Madison Comprehensive Plan and the Madison Area Metropolitan Planning Organization’s Regional Transportation Plan recommend an update of the Isthmus Area Traffic Redirection Study that was substantially completed in 1979 and followed by subsequent more-detailed studies of particular recommended components. In addition, neighborhood plans request traffic studies to evaluate changes to the circulation system, to address specific traffic concerns and issues within individual neighborhoods. Studies such as this, while including the downtown, would need to be much broader in order to adequately evaluate alternatives and the implications of alternative choices.

Traffic circulation studies for individual neighborhoods, and a transportation study for the downtown/isthmus area, including an update of the Isthmus Area Traffic Redirection Study, would consider not only the need to move automobile traffic to, through, and within the Isthmus, but also need to evaluate the role of transit and other transportation modes in moving people and goods through and within the Isthmus. The long-range implications of traffic on the downtown, the Isthmus neighborhoods, and the larger community would need to be considered together. This scope is reflective of elements commonly included in a comprehensive downtown transportation plan.

To conduct an analysis such as this and prepare an Isthmus Area Transportation Plan would be a significant multi-year undertaking. Extensive multi-modal travel-demand and travel operational/intersection modeling would be required. Data requirements to feed/drive, calibrate and validate the travel demand and operations models would be extensive. A major public participation effort would also be required.

A multi-year transportation planning initiative such as the one described above including an update of the Isthmus Area Traffic Redirection Plan, should include all modes of transportation and must adequately consider the implications for the Downtown/Central Business District, Isthmus neighborhoods, existing commercial corridors and the entire Madison community. Because the vitality of the City's Downtown and Isthmus neighborhoods is directly related to the health of the entire city and by extension the region, significant changes in traffic circulation which affect access to, from, within, and through the Isthmus must be carefully considered. The cost and time involved in undertaking an update of the Isthmus Area Traffic Redirection Plan (as recommended in the City’s Comprehensive Plan) should not be underestimated. The City would need to identify adequate resources and budget funding for such a study.
A comprehensive transportation and parking strategy will enable higher density development to occur in a more sustainable manner; will enhance mobility for employees, customers, visitors and residents; will differentiate the Downtown and greater Isthmus from suburban centers and be a catalyst for more successful growth.

**ALTERNATIVE TRANSPORTATION MODES AND PARKING EFFECTS**

Figure 33 (See Page 29) indicates the typical amount of parking required by professional guidelines and the zoning ordinance to serve a stand alone 100,000 square foot office building and the physical size of the structure needed to accommodate all of the cars. Without alternative modes of transportation, programs designed to reduce automobile use for this stand alone use and initiatives to reduce project-by-project off-street parking, a significant amount of land area and building volume will have to be devoted to parking. Methods which can be used to encourage the use of alternative modes of transportation and reduce the demand for parking and provide for shared parking among uses within the corridor should be explored and addressed before individual development projects occur. Methods exist that can reduce the aggregate need for parking and can be successfully implemented by businesses and developers working with the City to address the effects of the proposed development on the City’s traffic circulation system. These tools include the preparation of project-specific traffic studies, and transportation demand management plans, the use of shared parking, parking cash-outs, transit opportunities, live-work development, and community cars.

**PROJECT-SPECIFIC TRAFFIC STUDIES**

Redevelopment projects needing conditional use approval or a zoning map amendment should submit a traffic study for the development when requested by the alderperson and by the Traffic Engineer. A typical traffic study would include a description of the proposed project, an estimate of the projected transportation and vehicle traffic generation from the project, and an analysis and recommendations for addressing any potential traffic congestion or conflicts resulting from the project.

A study would include, for example, recommendations regarding required parking, site ingress and egress, potential traffic circulation diversion into or through the surrounding neighborhoods, traffic on primary access routes and at intersections, and recommended traffic control or traffic calming measures as may be needed to respond to the projected traffic increases. This evaluation should be based on the recommendations included in the Plan and City ordinances. If the project is planned to occur in phases, the traffic study should address the cumulative effects of each phase of the project. The assumptions and recommendations used in the traffic study should be coordinated and consistent with the assumptions and recommendations used in the transportation demand management plan. In their review of development proposals along the East Washington Avenue Corridor, the Plan Commission will consider the information provided by the traffic study regarding the transportation demand management planning, and/or participate in a transportation management association (TMA) if one is available in the area. Transportation Management Associates are member-controlled organizations that provide transportation services in a particular area such as a commercial or employment district. TMA’s provide an institutional framework to implement TDM plans and programs. The TDM plan should generally describe the applicant’s commitment to reducing the number of single-occupant automobile trips and list the methods the applicant intends to use. These methods should be based on the transportation choices currently available and it is recommended that they include an agreement to provide all employees with either the full price to purchase a monthly Madison Metro bus pass, or three or more of the following options:

- Ride sharing/carpool matching
- Preferred parking for ride sharers
- Secured bicycle parking, showers and lockers
- Employee commuting subsidies or awards
- Emergency ride home program
- Employer subsidized bus passes
- Provision of real-time transit information
- Other options proposed by the employer to discourage the use of single-occupant vehicles and as approved by the City

The provisions of an employer’s TDM plan should be available to all employees. The plan should describe the traffic and parking effects of the proposed development and should provide specific details on the measures the employer will use to monitor the traffic and parking effects. Developers are encouraged to seek ways to reduce off-street parking requirements. The TDM plan should be reviewed by the Traffic Engineer in concert with the Planning Division Director, and should be periodically updated. In considering individual development proposals, the Plan Commission should consider the proximity to transit routes and bicycle.
paths, the availability and accessibility of alternative parking, existing and potential shared parking arrangements, the number of residential parking permits issued within the area, and the potential effect of on-site parking or lack thereof on adjacent residential neighborhoods.

**Shared Parking**

Figure 15 (Future Land Use) presented earlier in this chapter identifies several possible locations for shared parking facilities. These are large parking structures that would serve more than one development and could be developed, owned and operated by the City or private entities. Shared facilities usually have fewer stalls than the total required for individual projects due to differing work hours and the fact that not all employees and visitors are there all of the time. Further, as use of alternative modes of transportation increases within the Corridor, the parking needs of new development can be accommodated in existing shared facilities in the spaces that are being vacated by existing users as they shift away from automobile use.

**Parking Cashout**

Rather than spending capital dollars on constructing parking (which can cost in excess of $15,000 per space in a structure, not including the cost of land), employers may provide a direct cash subsidy to employees who use other transportation modes. Not only do such subsidies reduce capital costs, but operating and maintenance costs as well. The amount of the subsidy that is cost-effective for the employer to pay will vary depending on the cost of constructing the parking and the number of employees expected to participate.

**Transit Opportunities**

Providing viable transit alternatives is an obvious and critically important method for reducing automobile use. Already underway are two transit studies that could have a significant effect on the Corridor. One is a streetcar study being led by the City and the other is a commuter rail initiative being led by Dane County. However, both are still several years out from being constructed, assuming the studies prove them to be viable. In the interim, bus service provided by Metro Transit continues to provide an important transit option.

As an incentive to increase ridership, while still covering costs, Metro Transit (www.ci.madison.wi.us/metro/) offers the Unlimited Ride Pass Program to very large employers (those with over 1000 employees). Under the program, the employers are provided with swipe cards for their employees who use the bus. The employer is then billed on the actual use of the cards but at a substantially discounted rate from the standard fares. Although the program is currently limited to only the largest employers, it may be possible for an association of employers to negotiate a similar reduced fare program with Metro Transit.

Another incentive for transit use is the Commuter Choice program which allows employers to offer employees the ability to purchase transit passes with pre-federal income tax dollars. This is a federal program, but staff from Metro Transit can provide information to interested employers. Another incentive that any employer can provide is purchasing bus passes and providing them to employees at a discounted rate. This would be in lieu of the cashout described above but would provide the same benefits to the employer.

**Live-Work Relationship**

Providing housing for workers within direct proximity to their places of employment also can yield significant reductions in parking demand, as well as a host of other benefits. As noted in the previous chapter of this document, about 53% of the residents on the East Isthmus reported traveling to work alone in their car, as opposed to 66% for the city of Madison as a whole. A large number of the alternative trips include walking and riding a bike to employers who are close by. The opportunity to improve on this trend should be given serious consideration when planning housing developments on the north side of East Washington Avenue as a means of providing housing for those who will be working on the south side.

**Community Car**

Community cars are a growing concept across the country, including Madison. The Madison program, Community Car (www.communitycar.com), is a member-based business that provides cars by the hour to its members. The fleet currently includes several hybrid or fuel-efficient vehicles stored in locations near the University, Downtown and East Isthmus. The City and developers should coordinate with Community Car to provide additional vehicles and storage locations within the East Washington Avenue Corridor as new development/redevelopment occurs.

Under the Madison program the organization owns the cars; however, there are other models that also could reduce parking within the Corridor. One such program is the provision of cars for shared use by residents of new housing projects or employees of new businesses. As part of the development approval, the developer/business owner would agree to provide the cars in exchange for a reduction in the number of required parking spaces to be constructed with the development.
**Parking Screening**

Even with a multitude of transit options, parking — and lots of it — will still be a reality along the Corridor; however, it must not dominate it. Larger structures should be screened with ground floor uses or, at a minimum, with exterior finishes that belie the parking area behind them. Likewise, exposed surface parking should be kept to a minimum and screened with landscaping or buildings. In general, surface parking should be next to the building it serves, and not in front of it. Surface parking also should be avoided at corners. Although access to parking is preferred off of the north-south side streets as described below, no street face of a block should be dominated by exposed surface or structured parking.

**Parking Access**

In general, access to parking areas should be limited to the north-south side streets wherever possible. Given the high volume of traffic on East Washington Avenue and the desired character of the street as described in this Plan, parking areas and entries off of this street are not appropriate and should be avoided if other access is available. Where other options are not available, access points on East Washington Avenue should be kept to a minimum by sharing them between adjoining properties.

To protect the residential character of East Mifflin Street, parking areas and access points should also be kept to a minimum and, where present, should serve only development that directly fronts on East Mifflin Street. Likewise, traffic on East Main Street should be minimized by locating access points on the side streets.

In no case should the north side of East Main Street be viewed as "back of house" for development on East Washington Avenue. Again, no block face on any street, especially East Main and East Mifflin Streets, should be dominated by parking areas or structures.

Figure 34 graphically shows how these various transportation alternatives could offset the demand for parking within the Corridor.
APPENDICES

APPENDIX 1: UPPER LEVEL DEVELOPMENT STANDARDS
APPENDIX 2: OVERALL DEVELOPMENT POTENTIAL
APPENDIX 3A: CAPITOL GATEWAY CORRIDOR VIEW SERIES, EAST WASHINGTON AVENUE INBOUND
APPENDIX 3B: CAPITOL GATEWAY CORRIDOR VIEW SERIES, EAST WASHINGTON AVENUE OUTBOUND
APPENDIX 3C: CAPITOL GATEWAY CORRIDOR VIEW SERIES, MAIN STREET INBOUND
APPENDIX 3D: CAPITOL GATEWAY CORRIDOR VIEW SERIES, MIFFLIN STREET INBOUND
APPENDIX 4: POTENTIAL DEVELOPMENT SCENARIO, LARGE-SCALE CORPORATE HEADQUARTERS
APPENDIX 5: RESOLUTION RES-08-00166, LEGISLATIVE FILE ID NO. 05532, ADOPTED FEB. 5, 2008
The upper level development standards proposed illustrate concepts, and would require further study before being finalized as part of the Urban Design District 8 Standards. These concepts would only be applicable to buildings over 8 stories on larger lots.

Building Massing Standards for Blocks with 12-story and 15-story height limits:

A. Buildings are allowed to have a street facade of up to 5 stories along East Washington Avenue.

B. Additionally, a development may have a tower element:
   Any building mass over 5 stories may not exceed a footprint envelope of 130 feet wide parallel along East Washington Avenue, with a maximum depth of 200 feet (see Figures A & B).
   1. If construction methods and/or site characteristics deem it necessary, this envelope may be exceeded by 10%.
   2. Any other building mass above 5 stories, not confined within the tower envelope must follow a 45% stepback. (See Figure C)

C. Tower elements in blocks where height ranges are discussed are only allowed the lower height unless several criteria, or design elements are met, and approved by the Plan Commission. Height ranges occur on several blocks and include:
   1. 6-8 Story maximum range
   2. 8-10 Story maximum range
   3. 10-12 story maximum range
   4. 12-15 story maximum range

D. Design elements and criteria that would allow the Plan Commission to approve buildings in the upper range of building heights will be more fully developed by the Urban Design Commission and the Plan Commission when the standards for Urban Design District #8 are codified.
Existing Overall Development

Potential Overall Development

This overall birdseye view shows the significant development potential along the Capitol Gateway Corridor.

Existing Tenney-Lapham Neighborhood

Potential Tenney-Lapham Neighborhood

The 30 degree development setbacks along East Mifflin Street will help preserve the residential character of the Tenney-Lapham Neighborhood while allowing more intensive development along the East Washington Corridor.

Existing Yahara River Corridor

Potential Yahara River Corridor

The height limit of 3-4 stories along the Yahara River Corridor will help preserve the recreational setting while allowing limited development potential more conducive to a natural corridor.
APPENDIX 3A: CAPITOL GATEWAY CORRIDOR SERIES

First Street: Existing Development

This view illustrates the development potential at the intersection of First Street and East Washington Avenue. The building heights on the south side of East Washington Avenue are limited to 3-4 stories in height to preserve the residential character found along Main Street and in the Schenk/Atwood Neighborhood, located directly to the south. A height limit of 8 stories on the north side of East Washington Avenue is planned to accommodate potential intensive commercial or employment center development.

Yahara River Approach: Existing Development

Baldwin Street Approach: Existing Development

Few Street Approach: Existing Development

First Street: Potential Development

Yahara River Approach: Potential Development

A 3- to 4-story height limit exists across East Washington Avenue from Burr Jones athletic fields and open space, as well as along the Yahara River Corridor.

Baldwin Street Approach: Potential Development

The former Marquip Equipment manufacturing facility remains on the south side of East Washington, and new development may occur on the former Trachte Properties on the North side near Dickinson Street.

Few Street Approach: Potential Development

The Madison Metro Bus facility remains, while new development, limited to 3 stories, is possible along the opposing half block between East Washington Avenue and Curtis Court. The 3-story height limit is intended to complement the residential uses along the north side of Curtis Court.
The existing Madison Dairy building and Breese Stevens Field is shown on the right, the north side of the street, while a high intensity employment facility is displayed on the south side of the street. This view illustrates the massing standards as discussed in Appendix 1, (See Page 34). The light colored building tops illustrate the bonus available to developers if they provide an architectural building top or roof element that exceeds general design standards.

This view towards the Capitol Square from Livingston Street is in the heart of the four blocks that have the highest and most intensive development potential. While some restrictions, such as the 30 degree setback along Mifflin Street, north of East Washington help mediate character differential with surrounding neighborhoods, these blocks still will provide the best opportunity for intensive employment uses.

This final view illustrates how new development will frame the Capitol Building as one approaches the hill up to the Capitol Square. New development will be most intensive near the Capitol as to expand the Central Business District and create opportunities for economic interaction between existing and new development.
The following series of before and after images complement the last series. This time, we can see the potential development as we travel from the Capitol Square traveling Eastward.

Here, at the Square, the US Bank building dominates the view, and only a hint of the potential development is seen, due to the large gradient change down to Blair Street.

Once at Blair Street the most intensive development potential is again visible.
Paterson Street Outbound: Existing Development

In both images, Breese Stevens Field is plainly visible on the north side of the street.

Few Street Outbound: Existing Development

The Madison Metro Bus facility is plainly visible on the south side of the street, while lower-scale development is seen on the half-blocks between East Washington Avenue and Curtis Court.

Baldwin Street Outbound: Existing Development

Baldwin Street Outbound: Potential Development

Marquip on the right, medium-scale development on the left.

Yahara River Outbound: Existing Development

Yahara River Outbound: Potential Development

3 to 4 stories on the right to complement the residential uses and to provide ‘breathing room’ for the Yahara River.
This series of four images compares existing and potential development along the East Main Street Corridor.
Mifflin Street Inbound

Mifflin & Few Streets: Existing Development

Mifflin & Brearly Streets: Potential Development
Existing residential development shields the view from new redevelopment on East Washington Avenue.

Mifflin & Brearly Streets: Existing Development
Breese Stevens is visible in front of new development, but acts as a buffer. There are now limited views of the MG&E smokestacks.

Mifflin & Paterson Streets: Existing Development

Mifflin & Blount Streets: Existing Development

Mifflin & Paterson Streets: Potential Development
New residential development is visible here and takes advantage of the park and open space on the north side of Mifflin Street.

Mifflin & Blount Streets: Potential Development
The 30 degree development stepback on developments higher than three stories protects the view of the Capitol Dome, and allows new development to better relate to the existing residential uses on the north side of Mifflin Street.
APPENDIX 4: POTENTIAL DEVELOPMENT EXAMPLE

The Capitol Gateway Corridor Plan is designed such that new employment development potential is created adjacent to the existing Central Business District. Through its flexible development, building massing and land use recommendations, this plan encourages the development of both small start-up business opportunities, business incubators, as well as the potential for a relocation or establishment of regional or national headquarters or other large-scale employment projects.

The site’s adjacency to the Central Business District and the University of Wisconsin, quick access to the airport and interstate system, as well as access to Madison’s public transit system, open space and residential uses allows for unique development opportunities within the Corridor.

This development example, illustrated on the right, shows how a national headquarters project needing over one million square feet of office space and over 2,200 parking spaces could develop on two adjacent blocks within the Corridor.

Note that this development project does not even use the site to its fullest build-out potential. In order to create a development that relates well to its surroundings, the building’s massing is broken up into three separate tower elements, each of a different height. Two opportunities for semi-public/private open spaces are created, and the development redevelops an existing historic brick warehouse.

In contrast, an existing suburban office park development, illustrated on the far right, uses approximately the same amount of office space and parking ratios, but doesn’t have the immediate connection to the Central Business District, the University, and is a much less efficient use of valuable land on the periphery of the city.

The illustrations on Pages 43 and 44 further refine the massing studies shown in this Appendix and provides a clear example of how the use of the Plan’s recommendations provide a radically different perspective on the potential for the Corridor.

Two City Blocks (Brearly - Livingston Streets):
Each 330 feet by 600 feet = 210,000 sq. ft. each

Development Potential:
Block 1: 600,000 sq. ft. of employment uses and 1,120 parking spaces
Block 2: 600,000 sq. ft. of employment uses and 1,120 parking spaces

Comparison Office Park Development:
The two green blocks symbolize the size of two downtown city blocks within the Capitol Gateway Corridor.

Similar in size to our development scenario, at left, this national headquarters development project includes approximately 1 million square feet of office space, and 2,200 parking spaces.

**This development scenario also provides a large common open space, and does not fully build out the development to the maximum massing as allowed by the Plan’s recommendations.**
WHEREAS the East Washington Capitol Gateway Corridor Plan Advisory Committee was charged with the following tasks:

- Find a community consensus on how the Corridor will function and what it will look like as new investment and redevelopment occurs over time;
- Assemble a comprehensive profile of the current uses in the Corridor and an analysis of key development and business location opportunities;
- Recommend preferred land uses for properties both north and south of the Corridor, including major redevelopment sites and key areas of overlapping interest between numerous neighborhoods;
- Create corridor design guidelines and standards for new and renovated buildings and sites;

WHEREAS, during Phase Two (Fall 2005 through Fall 2006), the Advisory Committee reviewed, refined, and expanded the level of detail and direction contained in the land use plan and urban design district recommendations based upon continued community input and deliberations centered around consensus building; and

WHEREAS, the Advisory Committee hosted two large public information meetings to gather public input and present planning issues and background information, alternative development concepts for the planning area, and the draft recommended land use plan and urban design guidelines; and

WHEREAS, throughout both Phases of this process, multiple opportunities were provided for community input, questions and concerns, including 1) wide distribution of meeting agendas and minutes and other meeting materials to interested parties, 2) opportunities for public comment at all scheduled Advisory Committee meetings, 3) posting Plan drafts on the Capitol Gateway Corridor Plan website, 4) hosting two public information meetings, and 5) the use of East Isthmus Neighborhood Planning Council (EINPC) as a hired facilitator to provide direct linkages to the neighborhood associations affected by the plan; and

WHEREAS, after carefully considering and discussing the input from all committee, public, and neighborhood meetings on the draft Plan and after making final revisions, the Advisory Committee at their October 11, 2006, meeting approved a motion to adopt the East Washington Capital Gateway Corridor Plan Advisory Committee Final Report and submit it to the Madison Common Council; and

WHEREAS, the Final Report has been reviewed by City agencies.

NOW THEREFORE BE IT RESOLVED, that the Common Council accepts the East Washington Capitol Gateway Corridor Plan Advisory Committee Final Report as amended by the Plan Commission Subcommittee, and hereby adopts the East Washington Capitol Gateway Corridor Plan and Recommendations as a supplement to the City of Madison Comprehensive Plan and related neighborhood, corridor, and parkway plans outlined above, to be used to guide future land use and development in the East Washington Capital Gateway Corridor; and

BE IT FURTHER RESOLVED, that the Comprehensive Plan be revised to incorporate the land use classifications recommended in the East Washington Capitol Gateway Corridor Plan during the next annual Comprehensive Plan evaluation and amendment process; and

BE IT FURTHER RESOLVED, that the appropriate City staff are directed to work with neighborhood and business associations, property owners, residents and other interest groups to begin to implement the East Washington Capital Gateway Corridor Plan’s recommendations, and particularly adoption of the Urban Design District #8 Ordinance incorporating the Plan’s design recommendations that will be developed following Plan adoption; and

BE IT FURTHER RESOLVED that the appropriate City agencies consider including the recommendations of the East Washington Capitol Gateway Corridor Plan and Urban Design Guidelines in future work plans and budgets in accordance with the priorities stated in the Plan; and

BE IT FURTHER RESOLVED that in situations where they differ, the land use and urban design recommendations in the East Washington Capital Gateway Corridor Plan for the 600 through 1800 blocks of East Washington Avenue inclusive, including the frontage on East Mifflin and East Main Streets, shall supersede the recommendations in the adopted 2004 East Rail Corridor Plan; and

BE IT FURTHER RESOLVED that Planning Unit staff are directed to provide clarifying edits in the East Rail Corridor Plan to reflect these differences; and

BE IT FINALLY RESOLVED, that the East Washington Capitol Gateway Corridor Plan Advisory Committee will remain in effect until such time as the Urban Design Guidelines for Urban Design District #8 are complete, and the Advisory Committee has an opportunity to review the urban design guidelines, at which time, it will dissolve.
