Attachment C	Traffic Impact Analyses

1. Introduction

The Madison East-West Bus Rapid Transit (BRT) Project (the project) is a proposed 15-mile route serving east-west travel needs in central Madison, Wisconsin. The project extends from East Springs Drive on the east side of Madison to a proposed new park-and-ride at Junction Road on the west side of Madison. Operating primarily via East Washington Avenue, University Avenue, and Mineral Point Road, the project will serve the major regional destinations of the isthmus (downtown Madison), the University of Wisconsin-Madison (UW) campus, Madison Area Technical College, and major employers and several shopping centers located throughout the corridor. BRT buses would use a combination of center-running bus lanes, side bus lanes, and mixed-traffic lanes. The project also includes electric bus charging infrastructure at the Sun Prairie Park-and-Ride and the Metro Satellite Maintenance Facility where BRT layovers will occur.

This technical memo describes potential changes to traffic operations that are anticipated to result from the proposed project.

The East-West BRT will consist of three service patterns which overlap to offer five-minute headways in the core of the system. To minimize unnecessary transfers, each of these patterns will have short stretches that operate as a local service, indicated with dashed lines, would operate without BRT infrastructure.

Figure 2 is a guideway map of the proposed route. Guideways can be side-running (buses operate in the right-most lane), center-running (buses operate in the center lanes of the roadway where a median is sometimes located), or mixed-traffic (buses operate in general traffic lanes like any other vehicle). Typical sections are shown in Attachment B.

Figure 1: Project Location Map

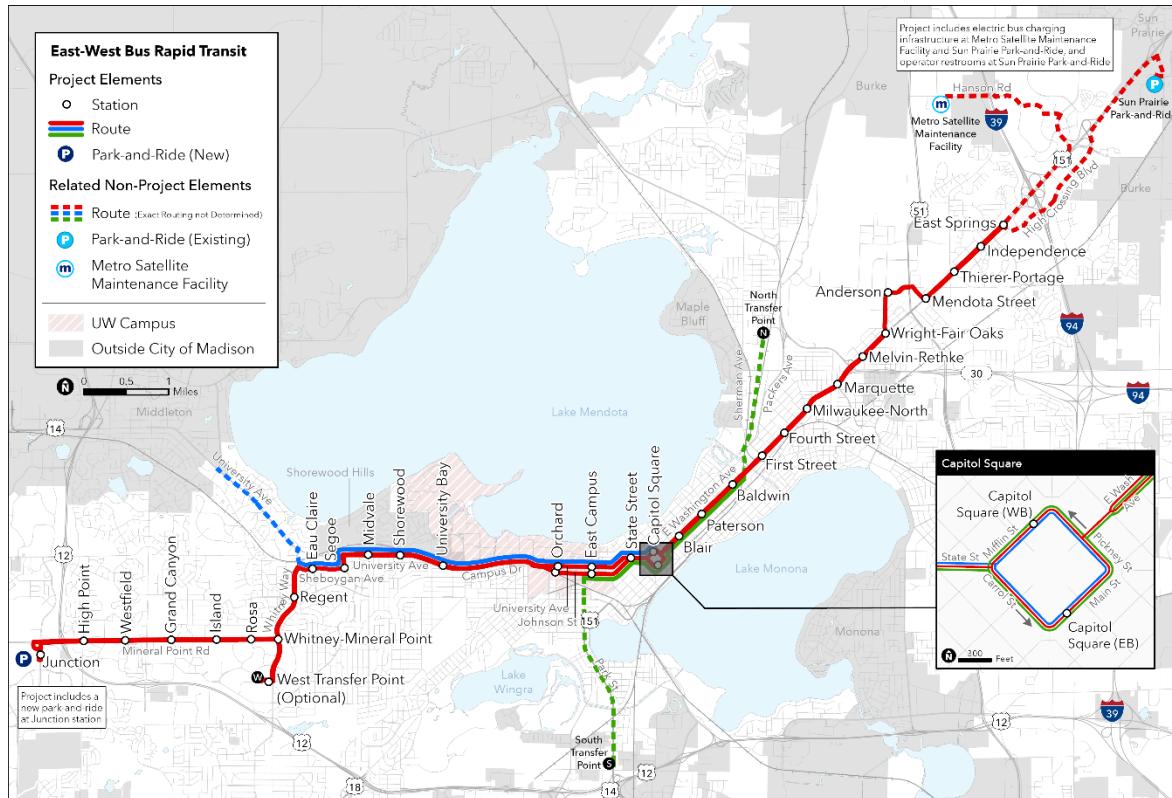

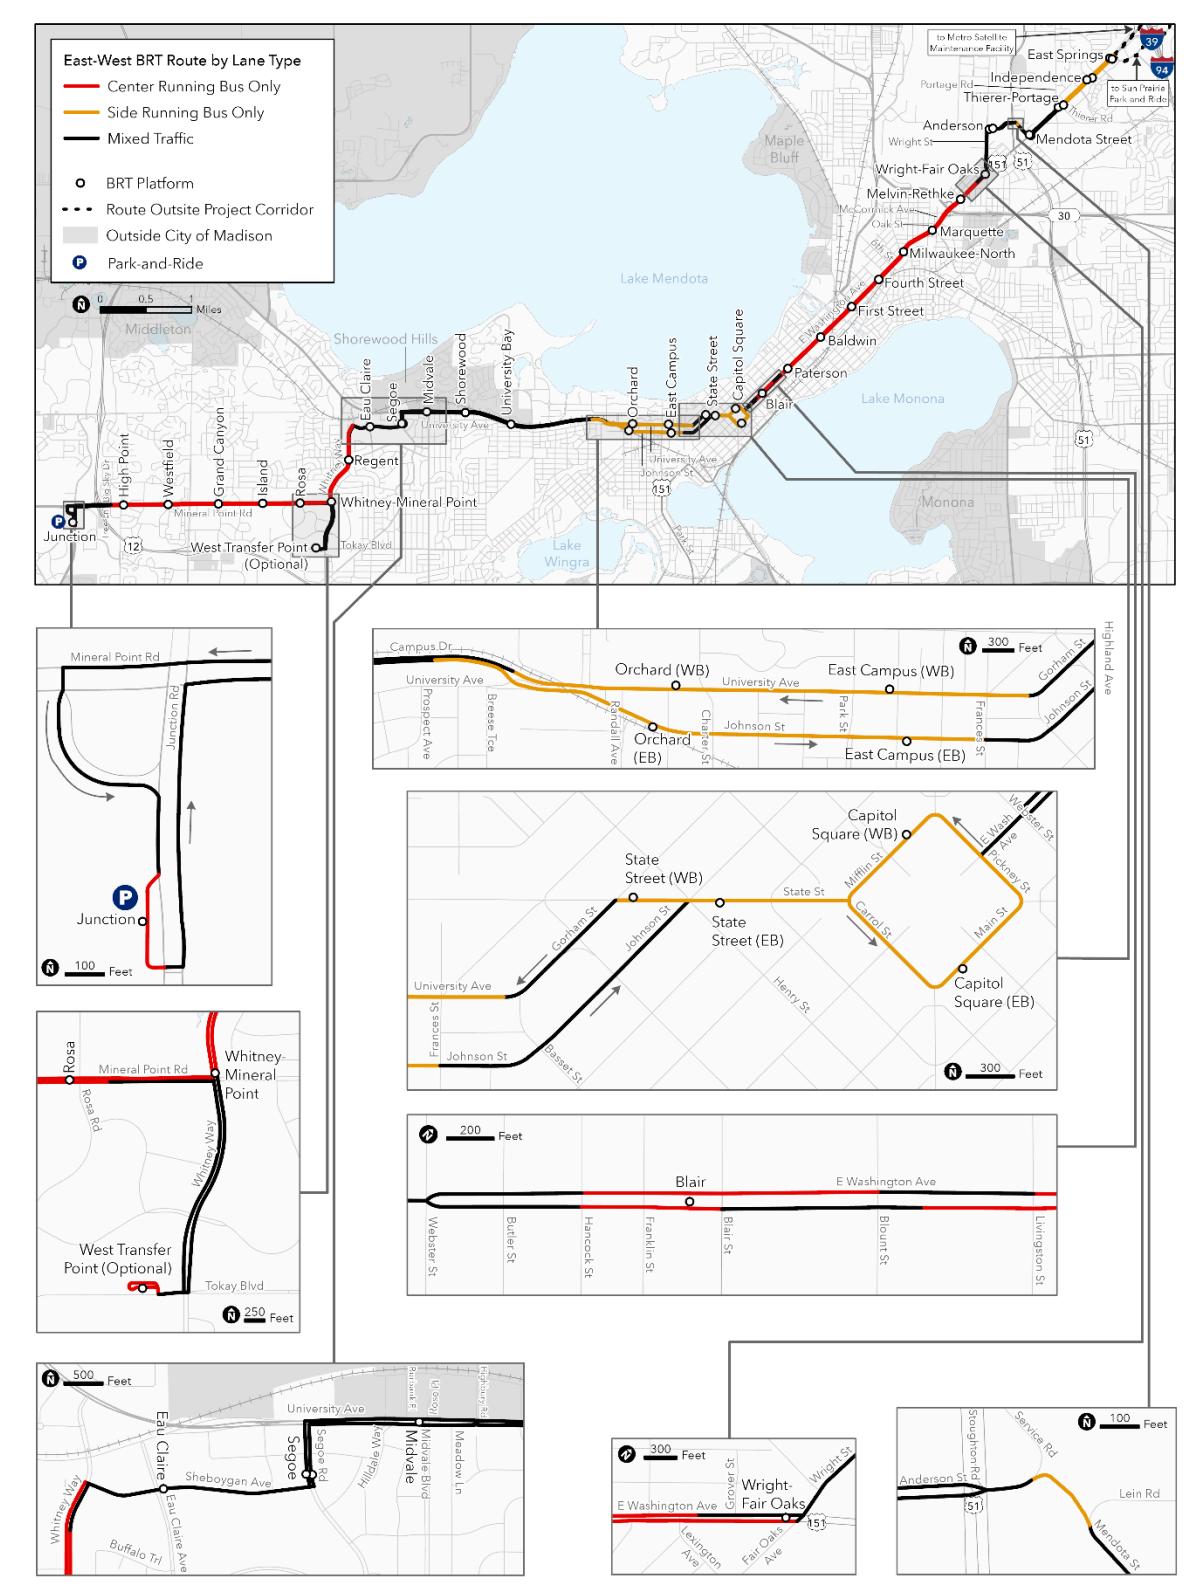

Figure 2: Guideway Map

2. Traffic

There are three ways that the project could affect traffic operations along the project route. These include:

1. Physical changes that affect capacity of the roadways
2. Operational changes to traffic signalized intersections
3. Bus operations (flow and starts/stops) that affect capacity along the roadways

2.1. Physical Changes That Affect Capacity of the Roadways

2.1.1. Lane Changes

Where the project proposes to convert a segment of the roadway's general-purpose traffic lane to a bus-only lane, capacity of the system to carry vehicles would be reduced because private cars and trucks would have fewer lanes to use. Refer to Table 1 for the existing and proposed number of lanes and current volumes on each roadway on the East-West BRT Project route. Typical roadway section schematics that show how existing roadways would be changed by the project are included in Appendix B.

Detailed information regarding traffic operations along East Washington Avenue is available in a separate traffic analysis report¹ included here as Attachment C. The traffic analysis report summarizes future operations on East Washington Avenue by stating, "In general, operations in 2034 with BRT in service results in more movements on US and state highway approaches experiencing LOS E and F operations compared to base conditions without BRT service." Table 1 summarize roadway lane configurations under existing and proposed conditions.

Table 1: Roadway Segment Summary: Volumes and Lanes

Roadway	AADT Range ²	Number of existing general-purpose vehicle lanes in each direction	Number of proposed general-purpose vehicle lanes in each direction with BRT
Mineral Point Road	26,750 – 32,550	2	2
Whitney Way	12,000 - 18,500	2	1
Sheboygan Avenue	4,600	1	1
University Avenue (west of campus)	40,200 – 54,400	3	3
Campus Drive	22,050 – 41,400	2	2
University Avenue	24,950 – 28,450	3	3
Johnson Street	22,050 – 30,950	4	3

Roadway	AADT Range ²	Number of existing general-purpose vehicle lanes in each direction	Number of proposed general-purpose vehicle lanes in each direction with BRT
East Washington Avenue (East of Livingston Street)	43,100 – 52,650	3	2 (3 lanes – same as existing condition – will remain in peak direction during peak hours)
East Washington Avenue (Milwaukee Street to Highway 30)	45,550	3 (Westbound) 3 (Eastbound)	3 / 2 (One general purpose traffic lane would be converted to a bus-only lane during morning peak hours. During peak hours this bus lane would be accessible by all traffic.) 3 / 2 (One general purpose traffic lane will be converted to a bus-only lane during <u>the evening peak</u> hours. During peak hours this bus lane would be accessible by all traffic.)
East Washington Ave (East of Highway 30)	35,850	3	3 / 2 (One general purpose traffic lane would be converted to bus-only lane that would be designated a bus-only lane during <u>off peak</u> hours. During peak hours that bus lane would be accessible by all traffic.)
Wright Street	7,850 – 12,850	1	1
Anderson Street (West of Eagan Road)	15,950	2	2
E Washington Avenue (East of Portage Road)	39,500 – 49750	4	3

Note: Gold shading signifies segment proposed for general-purpose lane reduction

Table 1 indicates five roadway segments that would experience a reduction in the number of general-purpose travel lanes with the introduction of the project. In general, this reduction results from dedicating a general-purpose lane to bus-only operations. Expected effects of the proposed lane reductions are described below.

- **Whitney Way.** Whitney Way has adequate capacity to handle the volume of traffic it experiences with a single lane in each direction. Signalized intersection timings would be optimized to alleviate potential queuing and delay caused by lane reduction at intersections on Whitney Way.
- **Johnson Street.** Currently, the outside lane on Johnson Street operates as a “de facto” bus and right turn lane because there is a high volume of regular transit buses and right turns that use this lane. Dedicating this lane to bus-only would not significantly change the way it is currently used and thus not significantly degrade operational quality.
- **East Washington Avenue.** East Washington Avenue already has excess capacity during non-peak times of the day. Additionally, fall 2020 traffic counts indicate the reduction in traffic volumes prompted by the pandemic are continuing. Therefore, reducing the general-purpose lanes during non-peak times is not anticipated to significantly degrade operational quality. East of Milwaukee Street (eastbound) and Highway 30 (westbound), two of the bus-only segments on East Washington Avenue would reopen to general traffic during peak periods to minimize operational degradation. The four-lane segment of East Washington Avenue east of Portage Road would have a permanent reduction of one lane. The outside lane in this segment primarily operates as a right-turn along the segment. Since the bus-only lane would be used by general traffic making right turns, this dedication of the lane to bus-only status is not anticipated to significantly degrade operational quality. Attachment C includes the traffic analysis report for East Washington Avenue.

2.1.2. Left Turns at Center Running BRT Lanes

Along the East Washington Avenue segments of the project, the center running BRT lanes would require the elimination of some left turn movements from East Washington Avenue to the side street network. Left turns that would be eliminated are listed in Table 2 and a map of locations of restricted left turn movements is available in Attachment A. More information regarding traffic volumes and operational characteristics along East Washington Avenue is available in the separate traffic analysis report in Attachment C. In addition, the elimination of one left turn on University Avenue is required.

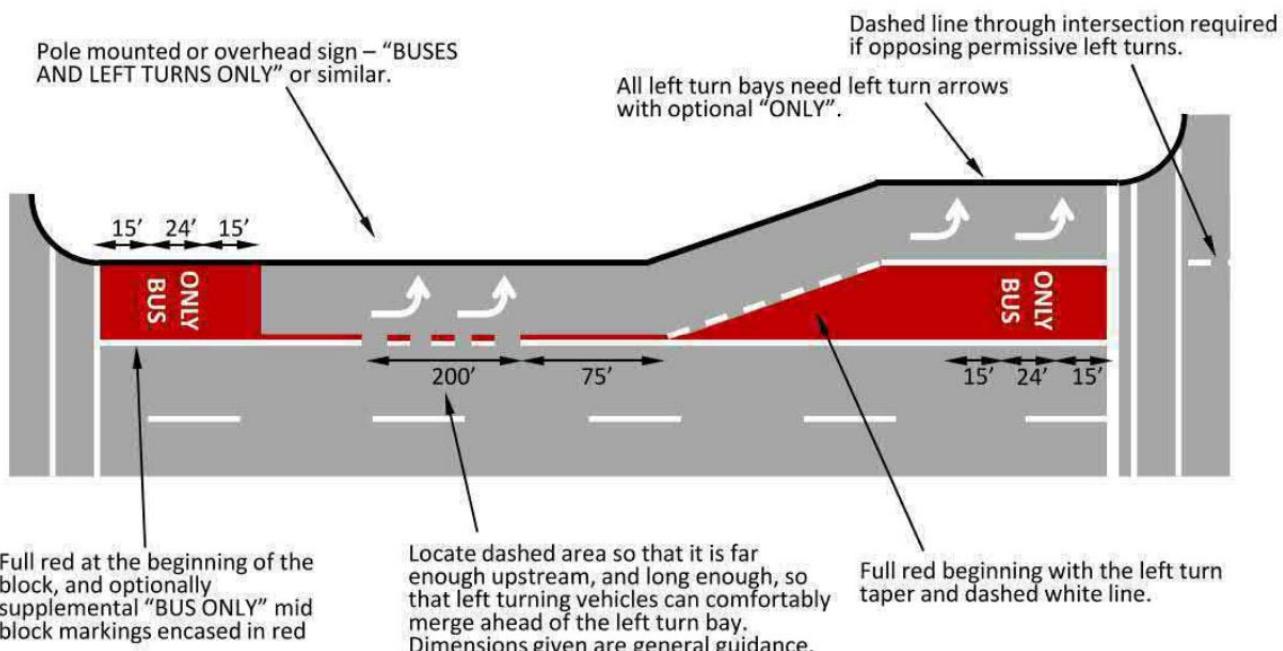

Table 2: Locations of Proposed Left Turn Movement Elimination

Intersection	Left Turn Eliminated
East Washington Avenue at Paterson Street	Eastbound
East Washington Avenue at Baldwin Street	Eastbound
East Washington Avenue at Fourth Street	Westbound
East Washington Avenue at Milwaukee Street	Westbound
East Washington Avenue at Melvin Court	Eastbound
University Avenue at Hill Street	Westbound (possible)

In addition to some restricted left turns, there are locations where left turning motorists would need to merge with the bus-only lane and cross that lane to access the left turn storage lane. These left turn movements would be present at all intersections in the center running guideway sections, (generally, along Mineral Point Road and East Washington Avenue) except at intersection locations with a center bus station; there, general motorists would not need to merge across the bus-only lane and instead would stay to the right of the station prior to making a left turn. There would be some potential added delay for left turning motorists who need to adjust speed to merge across the bus lane. Figure 3 provides a schematic of how these merge maneuvers would operate. These merges across the bus-only lane are not anticipated to add significant delay into the roadway

system. While some motorists would experience increased delay, others would experience decreased delay, resulting in no change to overall intersection delay.

Figure 3: Left Turn Merges Across Bus-Only Lane Schematic

2.2. Operational Changes to Traffic Signalized Intersections

Most routine traffic delay and congestion is related to the way an intersection is controlled by traffic signals, stop signs, or other treatments. The project would add traffic signals at select intersections and proposes to install transit signal priority (TSP) and other signalized intersection technologies to improve speed and reliability for the East-West BRT Project.

2.2.1. Additional New Traffic Signalized Intersections

The project proposes to add new traffic signals at the following locations, where access to the major road from intersecting minor roads is currently controlled by stop signs:

- Sheboygan Avenue and Segoe Road
- Sheboygan Avenue and Whitney Way
- Junction Road Park-and-Ride and Junction Road
- East Washington Avenue and Melvin Court / Rethke Avenue
- East Washington Avenue and Independence Lane

Each new traffic signal would add new delay to the primary roadway because at each of these intersections, the primary roadway is currently free-flow and does not need to stop for any side street traffic. When a traffic signal is installed, that primary roadway would have periods where traffic would be stopped at a red light to allow side street motorists to proceed. This would also tend to lessen the delay that a side street motorist experiences at these locations because there would be dedicated green, right-of-way time for side street motorists to drive through the intersections. Delay would vary based on the signal phasing at each intersection and some users would experience increased delay while others would have reduced delay; overall, a net change in delay is not anticipated.

All new traffic signals would be optimized to maximize efficiency and reduce delay of the new signalized intersections and of the overall system of adjacent signalized intersections. Signal phasing would be adjusted to accommodate these new signals with the goal of optimizing traffic operations and minimizing added delay.

2.2.2. Signalized Intersections with Transit Signal Priority

The East-West BRT route includes dozens of signalized intersections that direct motorists, bicyclists, and pedestrians. Many of the signalized intersections along the route are in coordinated systems in which the intersections effectively communicate with one another and can manage platoons of vehicles from one intersection to another. The project would add TSP along all intersections along the route from Junction Road to East Springs Drive. TSP equipment would allow traffic signals to communicate with approaching BRT buses and extend a green signal or shorten a red signal to minimize the time a bus spends stopped at a red light.

TSP would introduce some additional delay for the minor (side) street motorists because it would tend to favor increased efficiency for the main roadway. The increased side street delay would occur when a BRT bus approaches an intersection during a red signal on the main street (the street carrying the BRT bus) and causes the signal priority to shift from the side street to the primary street, or when a green signal is extended to allow a BRT bus to travel through the intersection. This would only slightly increase delay for side street motorists during the periods that a BRT bus is approaching and is not anticipated to be significant or recognizable by most motorists.

2.3. Bus Flow and Starts/Stops That Affect Capacity Along the Roadways

There are two ways in which the physical presence of BRT buses on roadways could affect the average motorist: added volume of buses on roads and the slowing, stopping, and starting of those buses.

Between the East Campus Mall and Capitol Square stations where the Red, Blue, and Green Lines³ overlap (see Figure 1), 12 BRT buses plus local buses would operate in each direction on the proposed route during weekdays. Between the Eau Claire Avenue and East Campus Mall stations where the Red and Blue Lines overlap, 8 BRT buses would operate in each direction during weekdays. Finally, between the East Campus Mall and First Street stations, where the East-West and North-South BRT routes overlap, 8 BRT buses would operate in both directions during weekdays. Fewer buses would operate during evening and weekend hours.

The addition of BRT buses would be offset by a planned systemwide route restructuring that would reduce duplicative service along the BRT route. BRT will serve about half as many bus stops as existing bus service does, but all will be in lane. The reduction or elimination of local bus service in the corridor results in a similar or lower number of buses and no significant impact to traffic flow.

2.4. Controlling Intersection Level of Service Changes Along the Route

The traffic analysis examined changes to level of service at nine controlling intersections along the East-West BRT route. Controlling intersections serve as the basis for traffic signal timings throughout the area and typically have the highest Vehicle to Capacity (V/C) ratio – an indication of congestion. Implementation of the Build Alternative would result in changes to level of service at several of these intersections compared with the No Build Alternative, summarized in Table 3. The addition of new signals and TSP would improve operations at several intersections compared with the No Build Alternative (highlighted in green) and would degrade operations at select intersections (highlighted in yellow), causing an LOS F at only one intersection: East Washington Avenue at Blair Street in the p.m. peak period.

³ The East-West BRT Project is designated to be called the Red Line. The Middleton (Blue) and North-South (Green) Lines are two additional BRT routes that Madison Metro Transit plans to introduce. These routes would use the East-West BRT infrastructure along the project route and local bus stops outside the corridor.

BRT operations were analyzed using 2019 traffic volumes; to date, traffic has not returned to 2019 levels because of travel behavior changes caused by the COVID-19 pandemic, suggesting that the modeling results are conservative. A City of Madison traffic volume analysis found that most arterials carried approximately 10 percent less traffic in September 2021 than in September 2019, and much of the traffic volume reduction is in the morning and evening peak periods. On East Washington Avenue, traffic volumes are approximately 55 percent and 70 percent of their pre-covid levels in the morning and evening peaks, respectively, from 2019 to 2021. An increase in telework and other travel behavior changes resulting from the pandemic may create a lasting pattern of reduced traffic volumes, leading to better traffic operations than what are portrayed in the operations analysis and throughout this section. In many cases where the overall intersection level of service (LOS) deteriorates, critical intersection movements are largely unchanged; some intersections operated poorly prior to the pandemic.

Converting one of the three existing general purpose lanes on East Washington Avenue to bus-only lanes impacts the LOS at certain intersections. However, microsimulation traffic modeling at these intersections indicates modest increases in queue lengths that can still be cleared during a single signal cycle. Additionally, while the implementation of East-West BRT is anticipated to result in reduced LOS at certain intersections, the project would increase the overall person throughput of the corridor.

Table 3: Existing and Proposed Levels of Service at Controlling Intersections

Intersection	AM Peak		PM Peak	
	LOS without Project	LOS with Project	LOS without Project	LOS with Project
Mineral Point Road at Gammon Road	D	E	C	C
Mineral Point Road at Whitney Way	C	C	C	D
Whitney Way at Regent Street	A	A	B	C
Johnson Street at Park Street	C	C	F	F
University Avenue at Park Street	C	C	D	D
East Washington Avenue at Blair Street	C	B*	E	F
East Washington Avenue at First Street	D	E	F	F
East Washington Avenue at Milwaukee Street	F	C*	F	C
East Washington Avenue at Zeier Road	F	C*	D	D

*Traffic signal timings were optimized with the implementation of the BRT service and some overall intersection LOS results improved.

As shown in Table 3, there are three intersections that are anticipated to operate at LOS F with the project, two of which (Johnson Street at Park Street and East Washington Avenue at First Street) would also operate at LOS F without the project. At the East Washington Avenue and Blair Street intersection, the increase in overall intersection delay during the evening peak period would result in a deterioration from LOS E without the project to LOS F with the project. This impact results from a reduction in the number of general purpose lanes on

eastbound East Washington Avenue. Three blocks south of East Washington Avenue along Blair Street, the City is currently making improvements to increase throughput at the five-way intersection of Blair Street, John Nolen Drive, and Wilson Street. These improvements are anticipated to help mitigate the loss of capacity on East Washington Avenue. Further, the City has adopted several plans and policies that accept some increase in vehicle delay to improve safety by reducing speeding and improve alternative modes of transportation. These plans include Madison in Motion, the City's transportation master plan⁴; Vision Zero⁵; and Complete Green Streets.⁶

The delays for movements on US Highway 151 (right turn from northbound Blair Street to East Washington Avenue and left turn from westbound East Washington Avenue to southbound Blair Street) are unchanged or improved and signal timings are optimized with implementation of the project.

Observation of microsimulation traffic modeling suggests similar northbound Blair Street (US Highway 151) queue lengths with or without the project. Microsimulation reports averaging the results from nine simulation runs indicate modestly longer northbound queue lengths without the project, with an average length of 640 to 660 feet and 95th percentile length of 1,030 to 1,070 feet. With the project, the average queue length is 580 to 590 feet, with a 95th percentile length of 920 to 950 feet. The eastbound queuing would worsen with the conversion of one of the three existing eastbound general purpose lanes to a bus-only lane, but as noted above, City policy supports these conditions considering the context adjacent to the Capitol Square and Capitol Loop in the City's downtown area.

2.5. Parking

The project would have some effect on street parking availability. Mineral Point Road, Whitney Way, University Ave, State Street currently do not have on-street parking and so would be unaffected by BRT routing. The limited parking that exists on portions of Johnson Street, the Capital Square, and East Washington Ave from Pinckney to Blair Street will remain.

On East Washington Avenue from Blount Street to Milwaukee Street/Highway 30, approximately 120 on-street parking spaces would be prohibited for about two hours in the a.m. peak direction and 142 on-street parking spaces would be prohibited for about two hours in the p.m. peak direction.

In addition, some riders currently access transit by parking on public streets prior to boarding the bus. This is common throughout the system and may continue with the implementation of BRT. If this continues with BRT, it would provide greater access to the system for area residents, but could reduce the availability of on-street parking.

Concern about parking on Regent Street was expressed by stakeholders in the University Hill Farms neighborhood. There are approximately 81 parking spaces along this segment. City staff conducted a parking inventory in this area on Tuesday, December 14, 2021 at approximately 9:30 a.m. and found 16 vehicles parked for a utilization of 20 percent. Satellite imagery from Google taken on Wednesday, October 3, 2018, showed 13 vehicles parked on the street in this stretch, a utilization of approximately 16 percent. Satellite imagery from Wednesday, June 4 and Thursday, June 12, 2014 and earlier dates shows similar or lower parking utilization. During this period of time before the COVID 19 pandemic, commuter bus traffic has served Regent Street and Eau Claire Avenue with equal or better service compared to the proposed BRT service during commute times.

⁴ Madison in Motion Transportation Plan. Available at <https://www.cityofmadison.com/transportation/documents/MIM/MIMReportWeb.pdf>. Accessed 5 May 2022.

⁵ Vision Zero Initiative. Available at <https://www.cityofmadison.com/transportation/initiatives/vision-zero>. Accessed 5 May 2022.

⁶ Complete Green Streets. Available at <https://www.cityofmadison.com/transportation/initiatives/complete-green-streets>. Accessed 5 May 2022.

To manage parking impacts, the City of Madison has a Residential Parking Permit Program (RP3) where residents can be given priority for parking through the purchase of permits, generally allowing them to park on streets for two days while unpermitted cars can only park for two hours. Program details are described in Madison General Ordinance 12.138 and on the City's website.⁷ Areas in the BRT corridor that are covered by the RP3 program include the University Hill Farms Historic District east and north of the area of concern, State Street Historic District, Saint Patrick's Roman Catholic Church, and the Wisconsin State Capitol (except for parking directly adjacent, which is controlled by the State of Wisconsin). Breese Stevens Municipal Athletic Field, Gisholt Machine Company, and Madison East High School are also in RP3 districts; as they are on East Washington Avenue, the peak hour restriction would limit all-day parking availability directly in front of these locations. The following figure illustrates that many centrally located residential areas along the BRT are within an RP3 area and have access to this management option.

Figure 4: RP3 Zones along East-West BRT Corridor

The project would also add surface lot parking at the west terminal and would serve the existing Sun Prairie Park-and-Ride. This parking would allow riders outside the BRT walkshed the opportunity to drive to the BRT terminal to access the system, and would also accommodate bike parking, pickups, and drop-offs. By expanding frequent service further from the central city and providing parking at the west terminal, the project could

⁷ City of Madison Parking Permits. Available at <https://www.cityofmadison.com/parking-utility/permits/residential-parking-permits>. Accessed 23 November 2021.

prompt riders who live farther from the city center to access BRT without parking on public streets or by using the Park-and-Ride lots.

3. Transit

Madison's proposed BRT routes are intended to serve as the core of the Metro Transit network. The East-West BRT Project would include bus lanes, BRT stations and infrastructure, TSP, and other components as described in Section 1.1 of the DCE. The North-South and Middleton BRT routes would use this BRT infrastructure when operating in the East-West BRT corridor and would use local bus stops outside the corridor. All three routes would use new branded BRT buses, most or all of which are planned to be electric.

Service levels on the BRT and local routes are shown in Table 4 below. The buses operating on all three BRT routes would be purchased as part of the project. In combination, the East-West, North-South, and Middleton BRT routes would offer a five-minute headway in the core of the system.

Table 4: East-West BRT Project Proposed Spans and Headways

Service Day	Span	East-West BRT	Middleton BRT (Capitol Square to Eau Claire)	Middleton BRT (Capitol Square to Middleton)	North-South BRT (East Campus to First Street)
Weekday	Early AM: 5 – 6 a.m.	30 mins.	-	-	30 mins.
	AM Peak: 6 – 9 a.m.	15 mins.	-	15 mins.	15 mins.
	Midday: 9 a.m. – 4 p.m.	15 mins.	15 mins.	-	15 mins.
	PM Peak: 4 – 7 p.m.	15 mins.	-	15mins.	15 mins.
	Evening: 7 p.m. – 12 a.m.	30 mins.	-	-	30 mins.
Saturday	Early AM: 6 – 7 a.m.	30 mins.	-	-	30 mins.
	Midday: 7 a.m. – 4 p.m.	15 mins.	-	-	30 mins.
	PM Peak: 4 – 7 p.m.	15 mins.			30 mins.
	Evening: 8 – 11 p.m.	30 mins.	-	-	30 mins.
Sunday	All Day: 6 a.m. – 11 p.m.	30 mins.	-	-	30 mins.

The BRT span of service (hours of operation) would be the same as local service (pre-pandemic), generally from about 5 a.m. to midnight on weekdays. Along most of the route, bus volumes would remain largely unchanged because East-West BRT would replace bus service hours already in the corridor. On some portions of the route, the number of buses would be reduced because fewer 60-foot buses would be needed to meet the same demand as the 40-foot buses currently used and because service would be restructured to be more efficient overall.

Several changes would need to be made to existing transit service when East-West BRT operations begin to reflect the enhanced service provided by East-West BRT. Most of the BRT system would operate in center-running lanes with station platforms requiring left side doors. Metro Transit's existing fleet of more than 200 buses have doors only on the right side and thus would not be able to serve BRT platforms. Several overlapping

local routes with lower service frequencies would be replaced with the three BRT routes.⁸ This service change would provide more frequent and reliable service than what currently exists in the corridor.

The changes to the transit network described in Table 5 reflect those described and mapped in Appendix D Service Plan and Operations and Maintenance Cost memo (March 2022).

Metro Transit is also leading the Transit Network Redesign (TNR), which is a separate action with independent utility. The TNR is intended to create a route system that will better serve Madison area residents and businesses by increasing access and frequency, decreasing travel times, and improving the quality of transit riders' experience. The projects acknowledge the effects of each other, but each project has value with or without the implementation of the other. Neither project restricts the consideration of alternatives of the other project nor do they trigger the other action. The Transit Network Redesign, if approved, will make broader changes to local bus service throughout the network and not just within the East-West BRT corridor. Its effects are not evaluated in this document.

⁸ Routes 2, 10, 11, 12, 15, 28, 56, 57, 70, 71, and 72 on University Avenue, and Routes 6, 14, 15, 25, 27, 29, 56, and 57 on East Washington Avenue would be substantially or entirely replaced by the East-West BRT Project, as summarized in Table 8.

Table 5: Transit Service Changes Necessary for East-West BRT

Route	Service Change/Potential Impact	Proposed Mitigation	Reduction in Service?
East-West BRT Project	New east-west BRT route with local service continuing past the eastern terminus to Sun Prairie and American Center; generally replaces the west half of Route 2, the east half of Route 6, Route 14, and Routes 26 and 36	Improves service; no mitigation needed	No
Middleton BRT	New Middleton BRT route with local service continuing west along Route 71 and 72 route patterns; generally replaces Routes 70, 71, and 72	Improves service; no mitigation needed	No
North-South BRT	New north-south BRT route from North Transfer Point to South Transfer Point via Packers Avenue and Park Street; generally replaces southern half of Route 5	Improves service; no mitigation needed	No
1, 4, 7, 8, 13, 16, 17, 18, 19, 20, 21, 22, 31, 32, 33, 34, 35, 38, 39, 40, 44, 47, 48, 49, 50, 51, 52, 55, 58, 59, 63, 68, 75, 80, 81, 82, 84	No change	No mitigation needed	No
2	Route shortened so that the western terminus is the UW hospital (western portion replaced by East-West BRT service); frequency reduced from 15 to 30 minutes during peak periods and remains 30 minutes the rest of the day	Although some riders would have to walk up to one-quarter mile farther to access a bus stop, East-West BRT would provide higher-frequency, more direct service than the Route 2 and results in a net improvement to transit access. No mitigation needed.	No
3	Route moved from University Avenue, Johnson/Gorham Street, and William Street to Broom Street/Bassett Street and Wilson Street/Doty Street to avoid duplication with BRT	Although some riders would have to walk up to one-quarter mile farther to access a Route 3 bus stop (one-half mile at the heart of Capitol Square), the existing level of service on Route 3 would be maintained. No mitigation needed.	No

Route	Service Change/Potential Impact	Proposed Mitigation	Reduction in Service?
5+6	The eastern half of Route 5 is combined with the western half of Route 6; the southern part of Route 5 would be replaced by North-South BRT and the eastern part of Route 6 would be replaced by the East-West BRT Project	Existing service along Routes 5 and 6 would be maintained or improved by the proposed changes: BRT service would provide better frequency throughout the day every day, and the new combined local route would maintain service in areas not served by BRT. No mitigation needed.	No
10	Route shortened and replaced by BRT east of Broom Street	East of Broom Street, Route 10 is redundant with Routes 2 and 5; while some riders south of Washington Avenue would have to walk up to one-quarter mile farther to access service, BRT would improve the frequency and quality of service. No mitigation needed.	No
11+12	Route shortened so that it operates from the Capitol Square to the east only; the western half of the route would be replaced by East-West BRT	Duplicative service would be eliminated when BRT is implemented and BRT would provide high-frequency service throughout the day; where BRT and local routes do not overlap, local service would be maintained with the same alignment and frequency. No mitigation needed.	No
14+15	Route combined into one route serving the Route 14 area north of Mineral Point Road and the Route 15 service area near Old Sauk Road	The service area along Mineral Point Road would be replaced with East-West BRT, which would improve service frequency and span. No mitigation needed.	No
23	Route shortened so that the southern terminus is the East Towne Mall; revised route would operate as a circulator from the East Towne Mall to Sun Prairie Park-and-Ride consistent with current route	BRT service south of the East Towne Mall would provide improved frequency and span compared with existing service and the revised Route 23 would provide the same level of service to the same areas that are currently served. No mitigation needed.	No
25	Replaced by East-West BRT	BRT service would provide improved frequency and span compared with existing service. No mitigation needed.	No

Route	Service Change/Potential Impact	Proposed Mitigation	Reduction in Service?
26	Replaced by East-West BRT	The East-West BRT extension to the Metro Satellite Maintenance Facility would serve the area currently served by Route 26. BRT service would provide improved frequency and span compared with existing service, which currently operates at 30-minute headways during the day and 60-minute headways early and late. No mitigation needed.	Minor increase in walking distance to access transit service in small areas
27	Replaced by North-South BRT	BRT service would provide improved frequency and span compared with existing service. No mitigation needed.	No
28+56+57	Routes combined and moved from Sheboygan Avenue to Old Middleton Road and from East Washington Avenue to Johnson Street / Gorham Street to avoid duplication with BRT. Service offered every 30 minutes all day, weekdays only.	Existing routes operate during peak periods on weekdays only. Route 28 provides 10- to 15-minute frequency and Routes 56 and 57 operate at 30-minute frequencies. The new combined route would provide improved span of service at a similar frequency. No mitigation needed.	No
29	Shortened so that the North Transfer Point is the southern terminus; south of this point, Route 29 would be replaced by North-South BRT	Duplicative service would be eliminated when BRT is implemented and BRT would provide high-frequency service throughout the day; where BRT and local routes do not overlap, local service would be maintained with the same alignment and frequency. No mitigation needed.	No
30	Extended to Portage Haye to replace part of the discontinued Route 6	Increase in service. No mitigation needed.	No
36	Replaced by East-West BRT	The East-West BRT extension to the Metro Satellite Maintenance Facility would serve the area currently served by Route 36. BRT service would provide improved frequency and span compared with existing service, which currently operates at 60-minute headways; no mitigation needed.	No
67	Replaced by East-West BRT	BRT service would provide improved frequency and span compared with existing service; no mitigation needed.	No

Route	Service Change/Potential Impact	Proposed Mitigation	Reduction in Service?
70	Shortened so that the Eau Claire station is the southern/east terminus; east of this point, Route 70 would be replaced by North-South BRT	Duplicative service would be eliminated when BRT is implemented and BRT would provide improved frequency compared with existing 60-minute frequency; where BRT and local routes do not overlap, local service would be maintained with existing circulation and service characteristics. No mitigation needed.	No
71+72	Routes 71 and 72 are essentially replaced by Middleton BRT	BRT service would provide improved frequency and span compared with existing service. No mitigation needed.	No

While there would be service reductions and even elimination of some local routes, the East-West, Middleton, and North-South BRT lines would replace this service, consolidating overlapping low-frequency routes into more frequent, visible, and higher-capacity service. The service changes described above intend to eliminate local service that duplicates BRT.

Table 6 summarizes the approximate number of weekday buses in 2019 (before the COVID-19 pandemic began) and the projected number of BRT buses proposed on weekdays in 2024 along the BRT route. While there is a decline in the number of buses in some areas, this does not represent a reduction in service. The decrease in bus volume occurs through what is called the “funnel,” where several routes converge to travel across the isthmus. Many of these buses do not have stops serving the surrounding areas; thus, implementation of East-West BRT would provide more frequent transit service with conveniently spaced stops while also reducing bus volumes in areas where residents and business owners are sensitive to traffic levels, including along State Street and near the Hill Farms historic district. Additionally, as noted above, the use of higher-capacity 60-foot buses would require fewer vehicles to meet the demand currently served by 40-foot buses.

Table 6: Existing and Planned Weekday Bus Volumes

BRT Route Location	2019	2024 BRT
	Weekday Buses	Weekday Buses
Mineral Point Road, West of High Point Road	36	128
Mineral Point Road, West of Island Drive	120	128
Whitney Way, South of Mineral Point Road	252	256
Whitney Way, North of Mineral Point Road	156	128
Sheboygan Avenue, East of Eau Claire Avenue	302	256
University Avenue at Shorewood Boulevard	504	240
Campus Drive	402	240
University Avenue and Johnson Street at Brooks Street	831	240 + 250-300 local
University Avenue and Johnson Street, Lake Street to Bassett Street	711	368 + 250-300 local
State Street at Fairchild Street	618	368
Capitol Square at Wisconsin Avenue and MLK Jr Boulevard	786	368 + 100 local

East Washington Avenue at Ingersoll Street	282	256
East Washington Avenue, East of Milwaukee Street	183	128
East Washington Avenue, East of Highway 30	129	128
East Washington Avenue at Thierer Road	123	128

4. Bicycles

In most cases bicycle accommodations would remain unchanged. The two exceptions are Mineral Point Road, where there would be an improvement, and East Washington Ave, where the westbound bike lane would be closed in the morning peak period and the eastbound bike lane would be closed in the evening peak period.

The East-West BRT lane configuration on Mineral Point Road would eliminate the existing shared bus and bike lane on the segment of Mineral Point Road. A widened sidewalk parallel to this segment of Mineral Point Road is proposed. It will replace the existing sidewalk and accommodate both pedestrians and bicyclists and provides a protected "All Ages and Abilities" enhancement to the bicycle network.

During peak hours, the proposed lane configuration along East Washington Avenue would eliminate an existing bike lane in the peak direction between Blair Street and Milwaukee Street/Highway 30. This measure is necessary to avoid significant motor vehicle delays and traffic diversion onto local streets.

The change is expected to require cyclists to divert to lower-stress parallel streets or paths during peak hours. The most convenient parallel routes include Capital City Trail and East Mifflin Street.⁹ Wayfinding signage would be added to help bicyclists navigate to alternative routes. The impact from the reduction of bicycle facilities in the peak hours in the peak direction is expected to be moderated with nearby parallel low-stress options, and with further planned expansion of the low-stress bicycle route network on the city's East Side. Though specific projects have not yet been identified, expansion of the East Side bicycle network is funded in the City's 2022-2026 Transportation Improvement Program.¹⁰

5. Summary

The project would introduce physical and operational changes to the roadways along the East-West BRT route. These changes would be in the form of actual physical lane changes, operational changes at signalized intersections, and addition of BRT buses to the traffic flow. None of the proposed changes are anticipated to introduce significantly degraded operations on the proposed roadways. Key summary statements from the motor vehicle operational analysis:

1. Segments of Whitney Way, Johnson Street, and East Washington Avenue between Portage Road and East Springs Boulevard during off-peak hours would experience a reduction in general-purpose travel lanes. Generally, these reductions result from dedicating one of the general-purpose lanes to bus-only operation. On East Washington Avenue, there would be no reduction in general purpose lanes during

https://www.greatermadisonmpo.org/planning/documents/TIPfinal22_WEB.pdf. Accessed 22 November 2021.

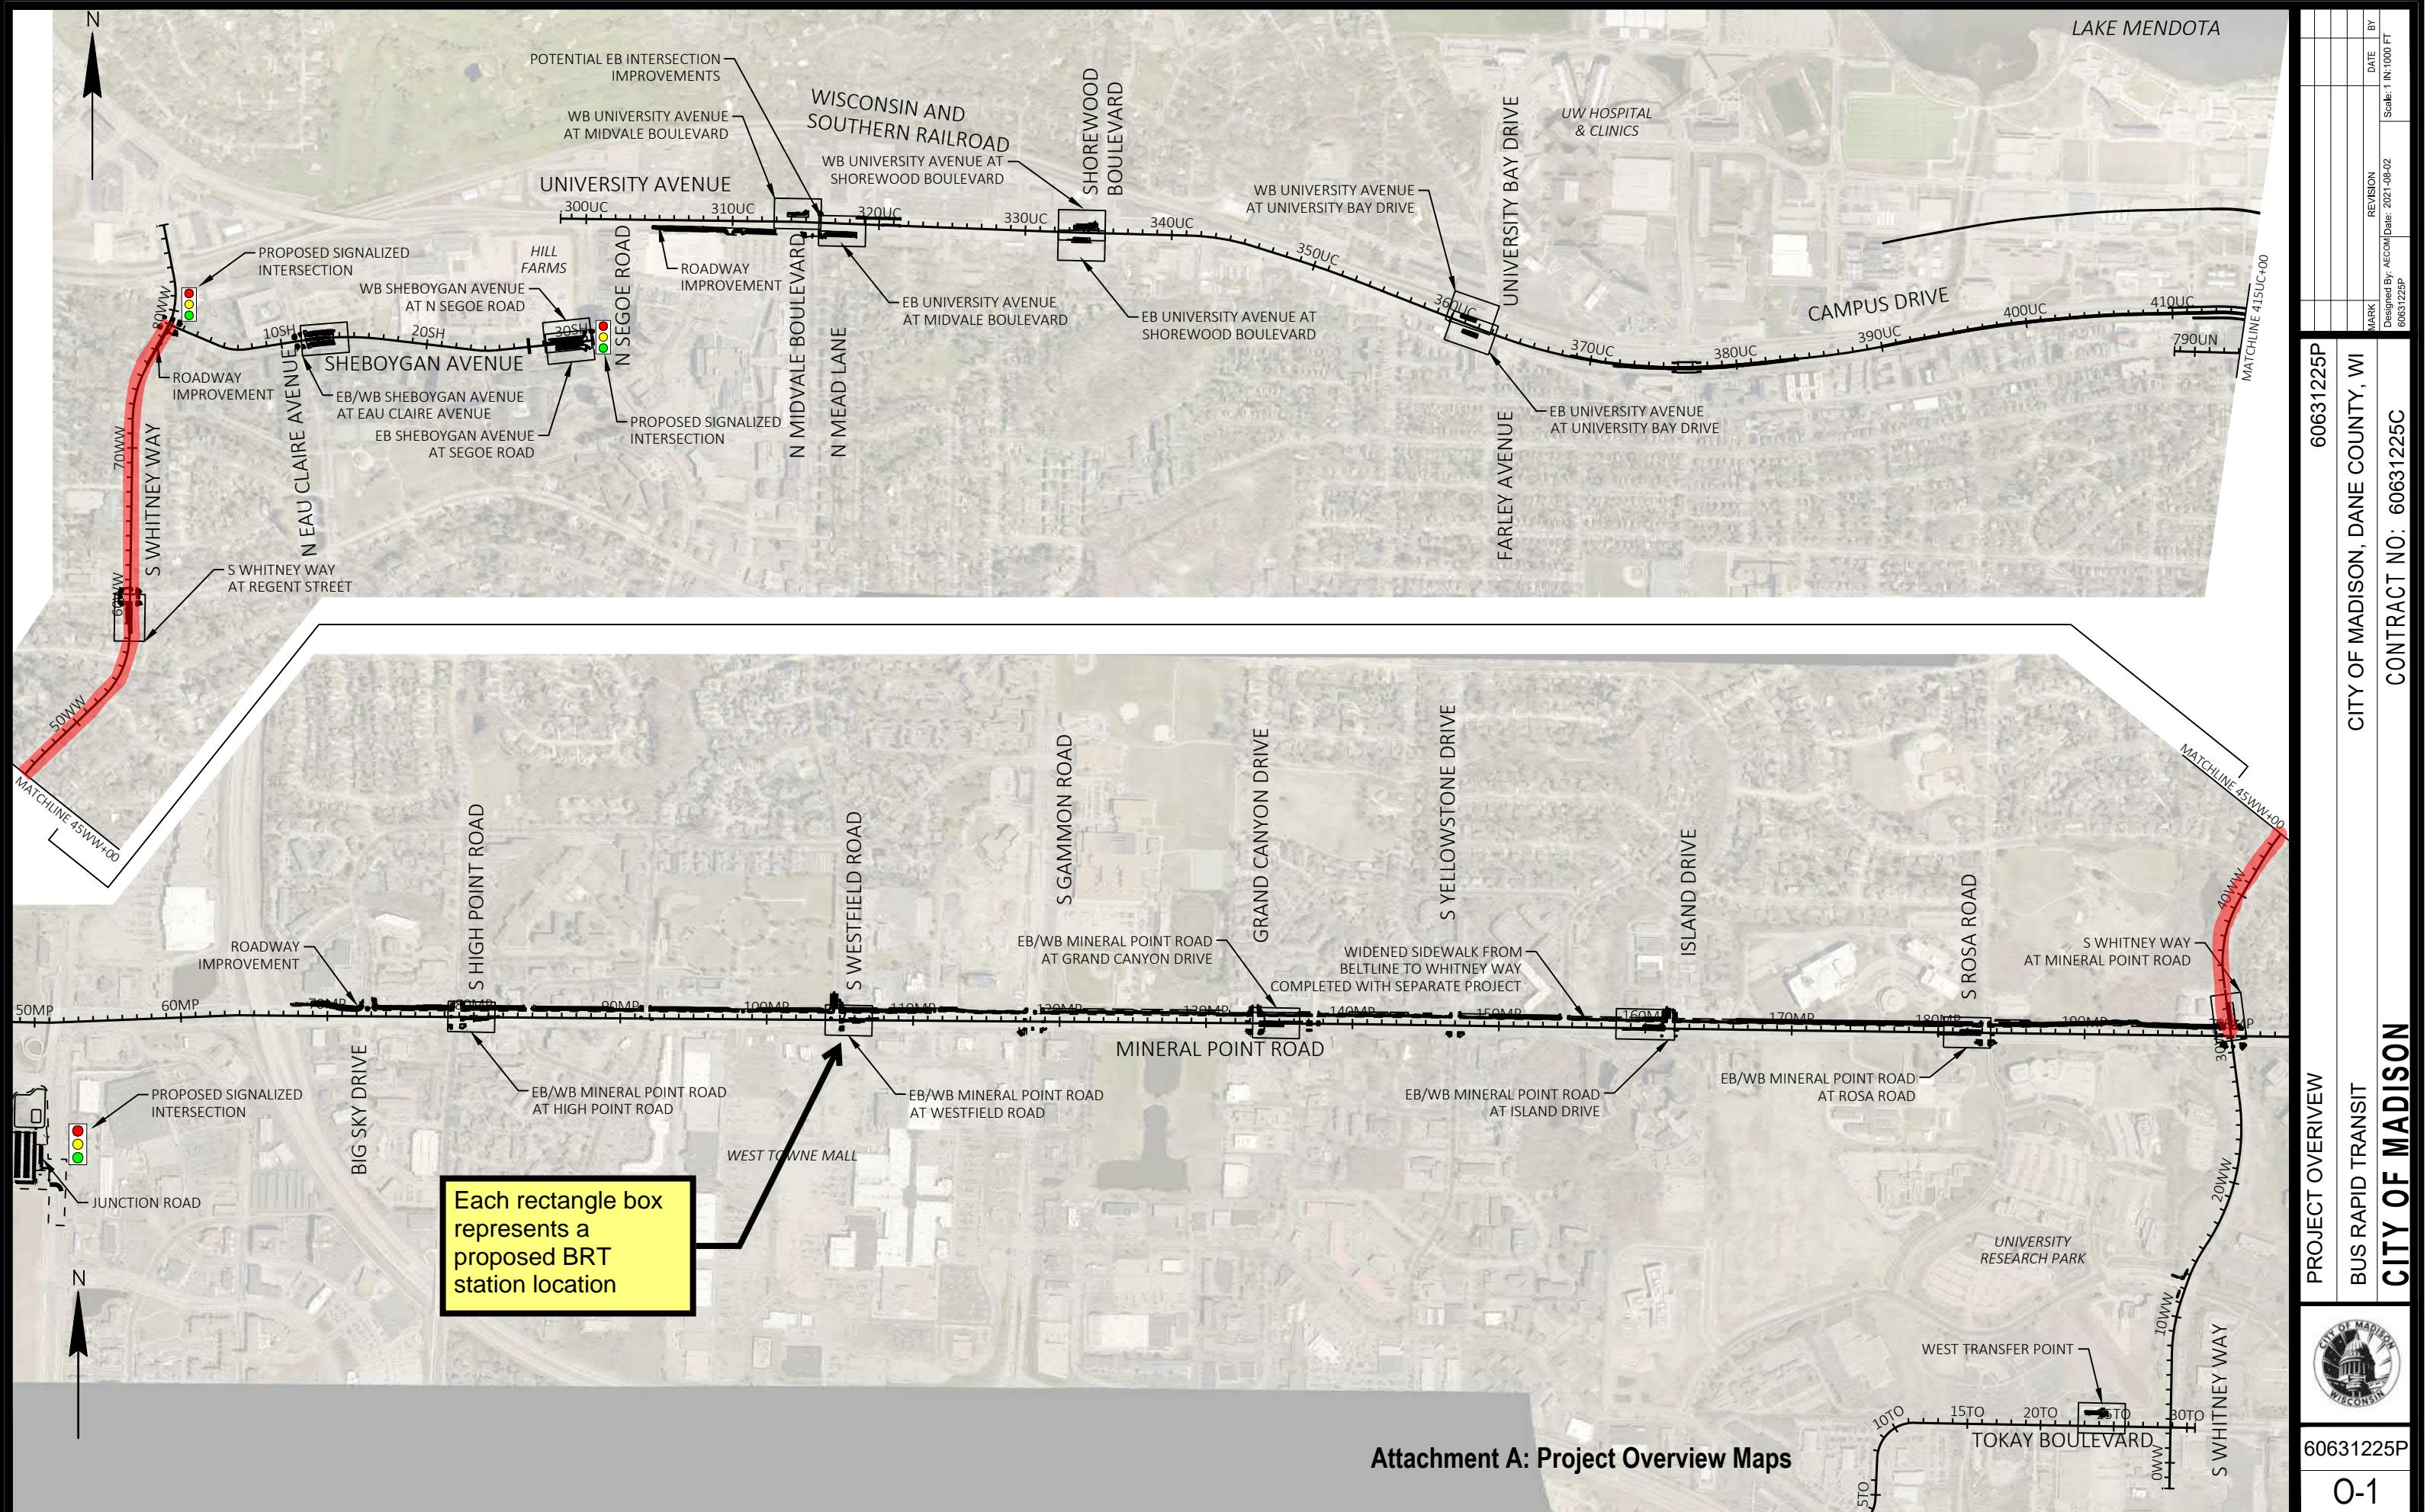

the peak hour in the peak direction. None of these lane reductions are anticipated to significantly degrade operational quality.

2. The project staff conducted a separate traffic analysis for East Washington Avenue between Blair Street and Wright Street, which would be reduced to two lanes in each direction except during peak periods. Attachment C documents the potential for some side-street motorists' delay at signalized intersections resulting from the introduction of the project (where side-street is defined as the street that intersects with the main BRT-carrying roadway).
3. The proposed center running bus operation on specific segments of East Washington Avenue would eliminate left turns at five cross streets; motorists accessing those five streets from Washington Avenue would be expected to alter their routes to accommodate these changes. Each of the proposed locations are considered relatively low-volume movements and these restrictions are not anticipated to significantly degrade operational quality.
4. The project proposes to add five new traffic signalized intersections. All new traffic signals would be optimized to maximize efficiency and reduce delay of the intersection and of the overall system of adjacent signalized intersections. The addition of these new signals is not anticipated to significantly degrade operational quality.
5. Most signalized intersections along the proposed route would be outfitted with TSP infrastructure to help maximize efficiency of the BRT system. The addition of this technology may inject minor delay into the side-street movements (see item two above for detailed analysis conducted along the East Washington Avenue corridor) but is not anticipated to significantly degrade operational quality; overall, intersection delay would remain approximately equal with or without TSP.
6. The project would result in six to 10 BRT buses per hour in each direction along certain segments of the route. These buses would operate either in dedicated lanes or in general purpose travel lanes. Lane reductions will be avoided during peak hours. The addition of these buses into the general traffic volume is not anticipated to significantly degrade operational quality.
7. An analysis of controlling intersections along the BRT corridor was performed and found modest impacts. Compared with the No Build Alternative, the BRT project would improve operations at three intersections in the a.m. peak and one intersection in the p.m. peak and would result in degraded operations at two intersections in the a.m. peak and three intersections in the p.m. peak. LOS would be unacceptable at two intersections during the p.m. peak under the Build Alternative.
8. The BRT corridor will remove few to no on-street parking spaces from the corridor, with the exception of East Washington Ave, which will prohibit on-street parking in the peak hour in the peak direction. Currently some transit riders park on local streets prior to boarding their bus. This may continue with BRT implementation. Madison has a Residential Parking Permit System in centrally located neighborhoods that help manage impacts from commuter parking.
9. Local bus service is planned to remain with small changes to accommodate the BRT service. Duplicative routes along the BRT corridor will be consolidated and replaced with the BRT service. Metro Transit is performing a Transit Network Redesign as a separate action which could have broader impacts to local service outside the corridor.

10. Bicycle accommodations would largely remain the same for most of the BRT route. Accommodations on Mineral Point Road will be improved through the provision of a widened sidewalk/path which will provide an "All Ages and Abilities" shared use path in place of the bus lane cyclists currently share with buses. On East Washington Avenue, bicycle facilities will be removed in the peak period in the peak direction from Blair Street to Milwaukee St/Highway 30. For much of this length, there are parallel low-stress bike facilities. As a separate project, the City of Madison has allocated about \$1 million in capital improvement funds to enhance east-west bicycle connectivity on the near-east side.

EXECUTIVE SUMMARY

ES.01 BACKGROUND

The City of Madison (City) and its consultant team are in preliminary design stages for the East-West Bus Rapid Transit (BRT) project. The Locally Preferred Alternative (LPA) generally runs from southwest of the intersection of South Junction Road and Mineral Point Road, through the Madison Isthmus, to East Towne Mall with some service extending to the Sun Prairie Park and Ride located southwest of the intersection of Reiner Road and O'Keefe Avenue.

East Washington Avenue is a high priority transit corridor for the City, and staff and elected leaders wish to increase the number of people being carried in buses. It also serves bicyclists in a shared parking and bike lane. The densification of the 700 to 1000 blocks has also led to increasing numbers of pedestrians and pedestrian crossings.

The City proposes dedicating the median (center) lanes for bus traffic from the Capitol Square to Wright Street. From Livingston Street to Milwaukee Street the existing parking/bike lane will remain, except during the peak hours in the peak direction where parking will be restricted, and it will become a general purpose travel lane. There will be no bicycle facilities in the peak direction during the peak hours along this portion of the corridor. From Milwaukee Street to Wright Street during the peak hours in the peak direction, the median lane will be open to mixed traffic. Therefore, in the section of East Washington Avenue where the BRT is proposed to be center running, the existing capacity of three lanes for general purpose traffic would be maintained in the peak directions during the peak periods.

The project team completed traffic modeling using Synchro11/SimTraffic11 software by Trafficware, Inc. to understand potential impacts of the proposed peak-hour lane configurations and left-turn restrictions associated with the BRT project. Full reports for all the intersections are provided in Appendices B through E and more detailed summaries are provided in Sections 2 and 3. Wisconsin Department of Transportation (WisDOT) staff and their representatives reviewed and provided comments on this report. The comments along with BRT team replies are included in Appendix G.

ES.02 2024 CONDITIONS

In general, motor vehicle operations in 2024 with BRT in service are similar to the base conditions. There is some congestion and queuing along US (United States) 151/East Washington Avenue in either scenario. Adding the BRT service combined with optimizing signal cycle lengths, phasing, and coordination scenarios results in a higher number of Level of Service (LOS) E and LOS F movements on the US and state highway intersection approaches.¹

Notably, the number of US and state highway *route motor vehicle movements* that operate at LOS F are the same or higher without the BRT service than with BRT service for all three peak hours: one versus one in the AM peak hour; one versus none in the noon hour; and eight versus six in the PM peak hour.

¹Level of Service is a measure of the average motor vehicle delay and uses a scale from LOS A (very little delay) to LOS F (volume exceeds capacity).

Bicycle level of traffic stress is a rating given to a road segment or crossing indicating the traffic stress it imposes on bicyclists². Levels of traffic stress (LTS) range from 1 to 4 as follows:

- LTS 1: Strong separation from all except low speed, low volume traffic. Suitable for children.
- LTS 2: Except in low speed, low volume traffic situations, cyclists have their own place to ride that keeps them from having to interact with traffic except at formal crossings. Physical separation from higher speed and multilane traffic. Crossings that are easy for an adult to navigate. Corresponds to design criteria for Dutch bicycle route facilities. A LTS that most adults can tolerate, particularly those sometimes classified as “interested but concerned”.
- LTS 3: Involves interaction with moderate speed or multilane traffic, or close proximity to higher speed traffic. A LTS acceptable to those classified as “enthused and confident”.
- LTS 4: Involves interaction with higher speed traffic or close proximity to high speed traffic. A LTS acceptable only to those classified as “strong and fearless”.

In 2024 without BRT service, bicycle accommodations are provided for the length of the corridor 24 hours per day. The bicycle LTS along East Washington Avenue from Blair Street to Marquette Street ranges from 2.0 to 2.5. With the proposed BRT service and associated lane usage the LTS along East Washington Avenue from Blair Street to Marquette Street continues to range from 2.0 to 2.5 during the off-peak periods. The LTS is 4.0 during the peak periods in the peak directions due to allowing general purpose motor vehicle travel in the shared parking/bike lane.

ES.03 2034 CONDITIONS

In general, motor vehicle operations in 2034 with BRT in service results in more movements on US and state highway *approaches* experiencing LOS E and F operations compared to base conditions without BRT service.

Notably, the number of US and state highway *route* movements that operate at LOS F is higher without the BRT service than with BRT service for all three peak hours: three versus two in the AM peak hour; one versus zero in the Noon hour; and ten versus nine in the PM peak hour.

In 2034 without BRT service, bicycle accommodations are provided for the length of the corridor 24 hours per day. The bicycle LTS along East Washington Avenue from Blair Street to Marquette Street ranges from 2.0 to 2.5. With the proposed BRT service, and associated lane usage, the LTS along East Washington Avenue from Blair Street to Marquette Street continues to range from 2.0 to 2.5 during the off-peak periods. The LTS is 4.0 during the peak periods in the peak directions due to allowing general purpose motor vehicle travel in the shared parking/bike lane.

The 2034 sensitivity analysis for motor vehicle traffic documented in this report applies a 0.94 percent annual growth rate over ten years at WisDOT's request. This represents more traffic volume growth from 2024 to 2034 than occurred from the early 2000s through 2019. The City agrees to monitor traffic volumes

² <http://www.northeastern.edu/pe-ter.furth/research/level-of-traffic-stress/>, accessed July 21, 2021

and operations along US 151/East Washington Avenue and coordinate with WisDOT to evaluate the need for and timing of any adjustments to BRT and general purpose time-of-day lane usage.

ES.04 SUMMARY OF ADDITIONAL WISDOT INQUIRIES

A. Provide Motor Vehicle Capacity Analysis for the Off-Peak Lane Reductions

The only intersection with marginal operations in the off-peak direction with the proposed general purpose lane reduction is First Street westbound during the PM peak hour. The westbound through movement operates at LOS D with an average of 53.7 seconds of delay per vehicle and a volume to capacity ratio (v/c) of 0.96.

These types of conditions for motor vehicle traffic are not out of character for the US 151/East Washington Avenue corridor in general, particularly in the peak inbound AM and outbound PM directions. The project team proposes that this is a reasonable tradeoff for providing a dedicated bus lane for BRT service as well as an on-street bicycle accommodation (shared with the on-street parking) for 22 hours of the day, particularly because removal of the on-street parking/bike lane increases the bicycle LTS to 4.0 because cyclists must take a full travel lane.

B. Provide Motor Vehicle Operations and Safety Analysis for the Left-Turn Restrictions

1. Operations Analysis

While the left-turns that receive additional traffic experience higher delay, none of them operate with a volume to capacity ratio that exceeds 1.0. The westbound left at Marquette Street drops just into the LOS F range during the PM peak hour with 86.9 seconds of delay per vehicle and a volume to capacity ratio of 0.86. Observation of the SimTraffic simulation does not suggest the westbound left operations or queuing are of concern for westbound US 151/East Washington Avenue traffic.

2. Safety Analysis

Based on the operations results, the project team does not foresee safety concerns associated with the left-turn restrictions and the redistributed traffic causing undue congestion. The local street system nearby is a grid, providing multiple route options for the redistributed traffic, which should help disperse it relatively quickly moving away from the US 151/East Washington Avenue corridor.

Some drivers may elect to perform a downstream U-turn maneuver in lieu of one of the restricted left-turn movements; however, U-turns are generally allowed on US 151/East Washington Avenue currently and the City has not identified any safety concerns associated with them. The City provided crash summary information indicating the percentage of East Washington Avenue crashes that were labeled as U-turn related from 2015 through 2019 was 0.46 percent. The peer corridors of University Avenue, Fish Hatchery Road, Park Street, and Stoughton Road had U-turn crash percentages ranging from 0.19 to 0.58 percent over the same timeframe. Though it is worth

noting that the number of intersections where U-turns are allowed, the number of opposing through lanes, and overall corridor lengths vary across these streets.

Based on the previous information, as well as the generally accepted premise that alternatives to left-turn movements tend to provide capacity and safety benefits (such as the quadrant intersection and Michigan U-turn designs), the project team does not foresee safety concerns associated with restricting the relatively low-volume left-turn movements at select center/median station locations.

C. Provide Operations Analysis for Blair Street, First Street, Mendota Street, Portage Road, and East Springs Drive

Full reports for these intersections are provided in Appendices B through E and a more detailed summary is provided in Section 3. Following is a summary of the 2024 modeling results only for locations that experience LOS F movements.

1. Blair Street

a. AM Peak Hour

Modest congestion and queuing occur at Blair Street in the Base Conditions (without BRT) but all movements operate at LOS D or better, except the northbound left, which is just into the LOS E range at 57.9 seconds per vehicle. The overall intersection operates at LOS C with 24.0 seconds of delay per vehicle.

When BRT service is added, the northbound left movement drops to LOS F with 102.8 seconds of delay per vehicle but operates below capacity with a v/c ratio of 0.87. The southbound left movement drops just into LOS E operations but has a low v/c ratio of 0.54. The other movements remain at LOS D or better and the overall intersection operates well at LOS B with 14.1 seconds of delay per vehicle.

b. Noon Hour (Not Applicable, no LOS F movements)

c. PM Peak Hour

Congestion and queuing occur at Blair Street in the Base Conditions (without BRT). The northbound right (US 151) operates at LOS F with 125.3 seconds of delay per vehicle and a v/c ratio of 1.15. The non-US/state route eastbound through and northbound left movements also operate at LOS F and the southbound left movement operates at LOS E. The overall intersection operates at LOS E with 70.3 seconds of delay per vehicle.

Congestion and queuing remain at Blair Street when BRT is in service. The optimized signal timings provide similar operations for the northbound right (US 151) movement operating at LOS F with 113.7 seconds of delay per vehicle and a v/c ratio of 1.13. The non-US/state route eastbound through and northbound left movements also operate at LOS F, and the southbound left movement operates at LOS E. The overall intersection

operations drop to LOS F with 141.1 seconds of delay per vehicle because of the eastbound through movement general purpose lane reduction from three to two.

Observation of SimTraffic microsimulation suggests similar northbound (US 151) queue lengths without versus with BRT service. SimTraffic reports averaging the results from nine simulation runs indicate modestly longer northbound queue lengths without BRT (average length 640 to 660 feet and 95th percentile length 1,030 to 1,070 feet) versus with BRT (average length 580 to 590 feet and 95th percentile length 920 to 950 feet). The eastbound queuing does worsen with the BRT service converting one of the three existing eastbound general purpose lanes to bus only, but City staff have reviewed this and are comfortable with these conditions considering the context adjacent to the Capitol Square and Capitol Loop in the City's downtown area.

2. First Street

a. AM Peak Hour

Congestion and queuing occur at First Street in the Base Conditions (without BRT). The eastbound left and southbound left operate at LOS E while the southbound through operates at LOS F with a v/c ratio of 0.89. The inbound/westbound through movement operates at LOS D but the v/c ratio is 1.10. The overall intersection operates at LOS D with 44.5 seconds of delay per vehicle.

When BRT service is added and the signal timings are optimized, the eastbound left, westbound left, westbound through, and southbound left operate at LOS E. The left turns have v/c ratios of 0.66 or less, while the inbound/westbound through has a v/c ratio of 1.07 (slightly better than Base Conditions). The overall intersection operates at LOS E with 60.4 seconds of delay per vehicle.

b. Noon Hour

Modest congestion and queuing occur at First Street in the Base Conditions (without BRT) with all movements operating at LOS D or better, except the eastbound left (LOS E with 65.5 seconds of delay per vehicle and a v/c ratio of 0.66) and the southbound left (LOS F with 103.6 seconds of delay per vehicle and a v/c ratio of 0.98). The overall intersection operates at LOS B with 17.0 seconds of delay per vehicle.

When BRT service is added, and the signal timings, phasing, and coordination is optimized, all movements operate at LOS D or better, except the eastbound left (LOS E with 56.3 seconds of delay per vehicle and a v/c ratio of 0.67), the westbound left (LOS E with 58.1 seconds of delay and a v/c ratio of 0.52) and the southbound left (LOS E with 69.5 seconds of delay per vehicle and a v/c ratio of 0.81). The overall intersection operates at LOS C with 33.0 seconds of delay per vehicle.

c. PM Peak Hour

Congestion and queuing occurs at First Street in the Base Conditions (without BRT), with three movements operating at LOS F: the eastbound through with a v/c of 1.30; the westbound right with a v/c of 0.09; and the southbound left with a v/c of 1.02. The overall intersection operates at LOS F with 102.4 seconds of delay per vehicle.

Congestion and queuing remain at First Street when BRT is in service. There are three movements that operate at LOS E: the eastbound left with a v/c ratio of 0.76; the westbound left with a v/c ratio of 0.59; and the southbound through with a v/c ratio of 0.74. The eastbound through operates at LOS F with a v/c of 1.27. The southbound left operates at LOS F with a v/c ratio of 1.19. The overall intersection operations are similar at LOS F with 105.9 seconds of delay per vehicle.

Observation of SimTraffic microsimulation shows similar operations without BRT compared to with BRT. In either case, despite the poor LOS and high v/c ratios predicted by HCS for the eastbound through movement, traffic in the simulation is nearly always accommodated in one signal cycle (cycle failures are rare and do not appear more frequent when BRT service is added).

3. Mendota Street

- a. AM Peak Hour (Not Applicable, no LOS F movements)
- b. Noon Hour (Not Applicable, no LOS F movements)
- c. PM Peak Hour (Not Applicable, no LOS F movements)

4. Portage Road/Thierer Road

- a. AM Peak Hour (Not Applicable, no LOS F movements)
- b. Noon Hour(Not Applicable, no LOS F movements)
- c. PM Peak Hour (Not Applicable, no LOS F movements)

5. East Springs Drive

- a. AM Peak Hour (Not Applicable, no LOS F movements)
- b. Noon Hour (Not Applicable, no LOS F movements)
- c. PM Peak Hour (Not Applicable, no LOS F movements)

D. Provide Operations Analysis for Any Bus Signal Phases

The only intersection along US 151/East Washington Avenue where a bus-only signal phase is proposed is at First Street. The phase would accommodate outbound BRT buses providing north to south service making the eastbound left-turn movement from East Washington Avenue to First Street. These buses would get their own signal phase while all other traffic faces a red signal. The north to south service is proposed to have a 15-minute headway.

The operations modeling indicates the addition of a bus-only phase that occurs only once every 15 minutes has mostly negligible impacts on operations at US 151/East Washington Avenue and First Street. Some movements experience increased delay while others experience decreased delay. For all three hours considered the overall intersection delay and v/c ratio is the same, or a little less, with the added bus phase.

SECTION 1
BACKGROUND AND METHODOLOGY

1.01 BACKGROUND

The City of Madison (City) and its project team are in preliminary design stages for the East-West Bus Rapid Transit (BRT) project. The Locally Preferred Alternative (LPA) generally runs from southwest of the intersection of South Junction Road and Mineral Point Road, through the Madison Isthmus, to East Towne Mall with some service extending to the Sun Prairie Park and Ride located southwest of the intersection of Reiner Road and O'Keefe Avenue. Service using BRT buses, but without BRT station amenities is also planned west to the City of Middleton, south to the South Transfer Point at the Park Street and Badger Road intersection, and north to the North Transfer Point at the Aberg Avenue and Huxley Street intersection. Figure 1.01-1 shows proposed BRT system.

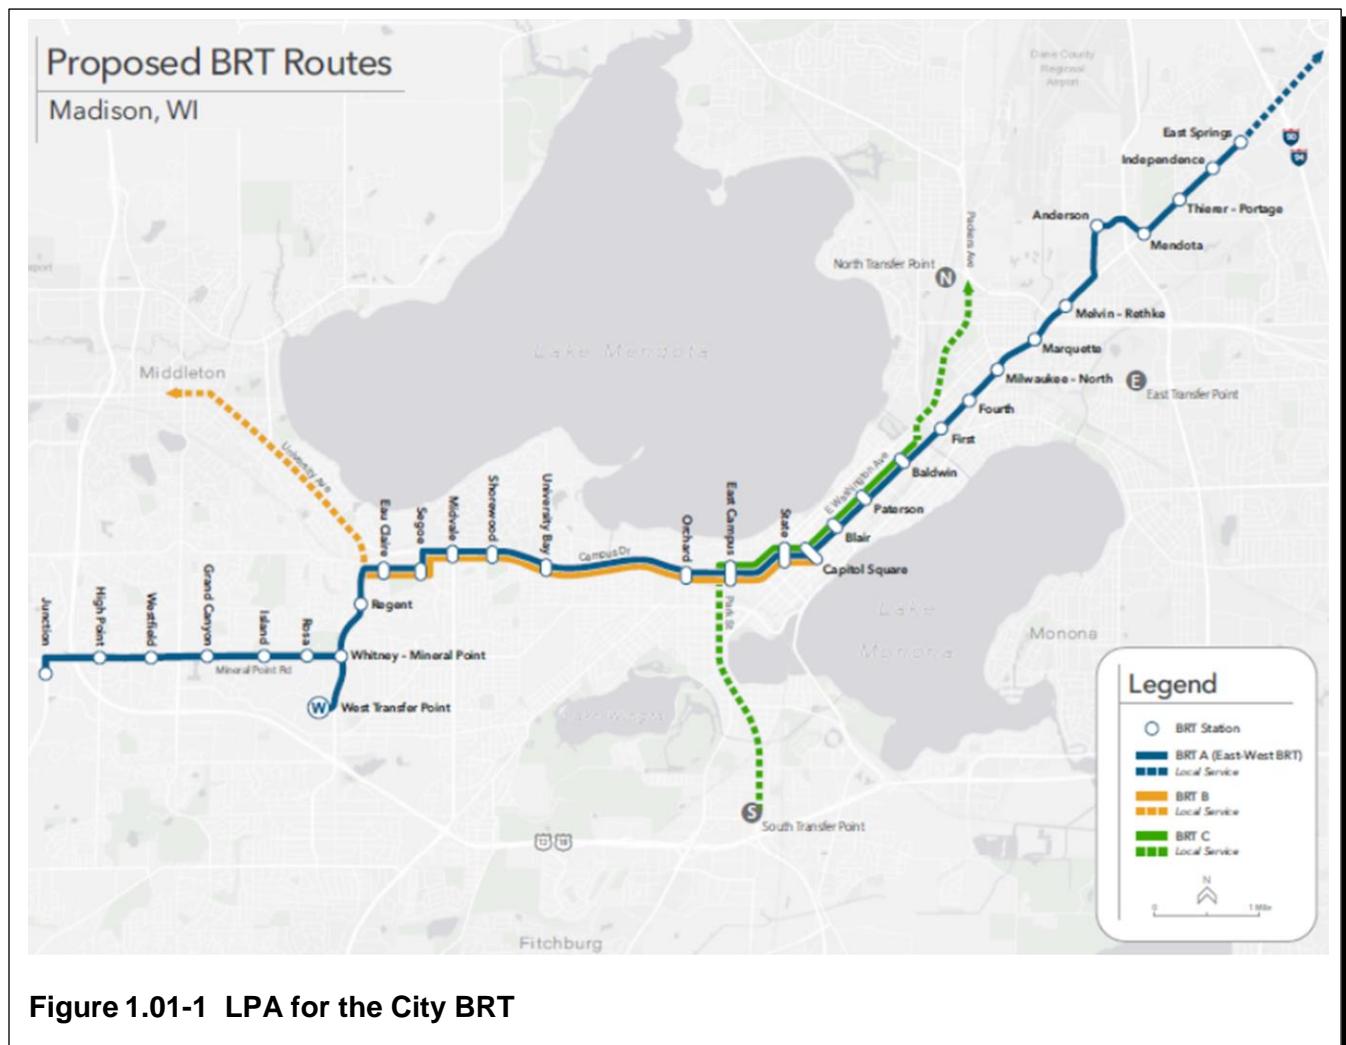

Figure 1.01-1 LPA for the City BRT

East Washington Avenue is a high priority transit corridor for the City, and staff and elected leaders wish to increase the numbers of people being carried in buses. It also serves bicyclists in a shared parking and bike lane. The densification of the 700 to 1000 blocks has also led to increasing numbers of pedestrians and pedestrian crossings.

Along East Washington Avenue the LPA includes the following BRT elements:

1. On East Washington Avenue from Webster Street to Wright Street. The BRT buses are proposed to run along the median (center) travel lanes and serve stations located in the medians.
2. On Wright Street, Anderson Street (past Madison College), and Mendota Street, BRT buses are proposed to run in mixed traffic and serve stations located in the side terrace areas.
3. On US 151/East Washington Avenue from Mendota Street to Portage Road/Thierer Road: BRT buses are proposed to run in mixed traffic and serve stations located in the side terrace areas.
4. On US 151/East Washington Avenue from Portage Road/Thierer Road to East Springs Drive: BRT buses are proposed to run in the rightmost lane which will be converted from a general purpose lane and serve stations located in the side terrace areas.

A. Proposed BRT Lane Configurations

In the section of East Washington Avenue where the BRT is proposed to be center running, the existing capacity of three lanes for general purpose traffic would be maintained in the peak directions during the peak periods. Figure 1.01-2 shows the proposed BRT lane configuration from the Capital Square/Webster Street to Wright Street, where the BRT service will depart East Washington Avenue to serve Madison College on Anderson Street.

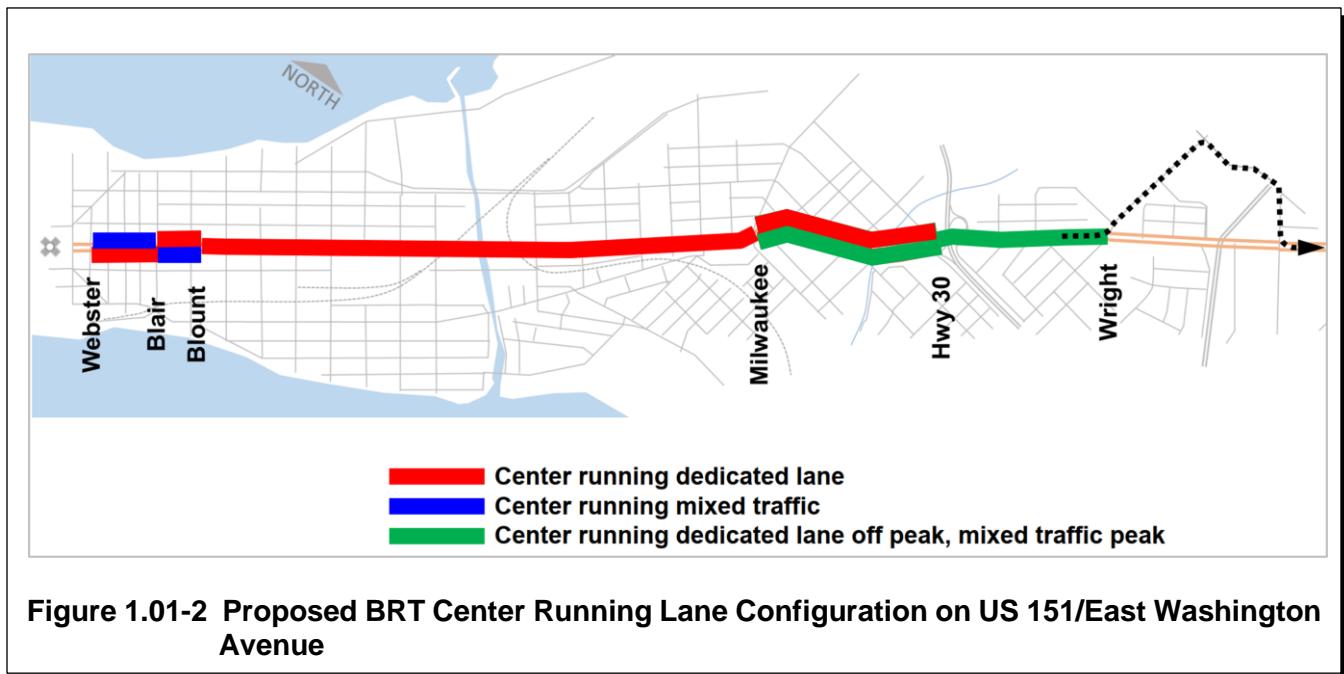

Figure 1.01-2 Proposed BRT Center Running Lane Configuration on US 151/East Washington Avenue

In locations where a shared on-street parking and bike lane currently exists, the BRT buses would use the center lanes and they would be designated as bus-only lanes 24 hours per day. The on-street parking would be prohibited during the peak periods in the peak directions to allow general purpose traffic to use them for travel (shown in red in Figure 1.01-2). To accommodate this, the existing curb bumpouts in these portions of East Washington Avenue would be removed to allow motor vehicle parking lane use during peak periods. Bicycle facilities would also cease to exist in the peak directions during the peak hours.

In locations where a shared on-street parking and bike lane does not exist the BRT would either operate in with mixed traffic 24 hours per day (shown in blue in Figure 1.01-2) or in mixed traffic in the peak direction during the peak periods only (shown in green in Figure 1.01-2) while operating in a bus-only lane outside the peak periods. The result is a corridor that provides an exclusive bus lane for efficient BRT service along nearly its entire length for 22 hours per day or more, yet does not reduce the existing peak period general purpose lane capacity (three lanes in the peak direction) from the existing conditions from the Capitol Square to Thierer Road/Portage Road. East of Thierer Road/Portage Road the LPA proposes converting the rightmost general purpose lane to a bus only lane 24 hours per day, reducing general purpose capacity from four lanes in each direction to three lanes in each direction.

B. Left-Turn Restrictions

In some locations the existing median width is not sufficient to support construction of a BRT station while also maintaining the existing left turn lane. The project proposes eliminating some left-turn movements on US 151/East Washington Avenue and using the existing left-turn lane areas to accommodate the stations. Figure 1.01-3 shows the intersections where left-turn movements would be eliminated, and the existing left-turn lane(s) would be used for the station areas.

Figure 1.01-3 Proposed Left-Turn Restrictions to Accommodate BRT Stations

The volumes for the left-turn restrictions are shown in Table 1.01-1.

Left Turn	AM Peak Hour (vph)	Noon Hour (vph)	PM Peak Hour (vph)
Eastbound left turn at Paterson Street	25	32	78
Eastbound left turn at Baldwin Street	45	69	121
Westbound left turn at Fourth Street	22	28	31
Westbound left turn at Milwaukee Street	52	29	46
Eastbound left turn at Melvin Court	11	21	45

Table 1.01-1 Left-Turn Restrictions Proposed

1.02 TRAFFIC ANALYSIS METHODOLOGY

The project team completed motor vehicle traffic modeling using Synchro11/SimTraffic11 software by Trafficware, Inc. to understand potential impacts of the proposed peak-hour lane configurations and left-turn restrictions associated with the BRT project. The existing conditions models were provided by City of Madison Traffic Engineering (TE) staff and represent the traffic signal timings and traffic volumes that existed in 2019, or pre-COVID pandemic conditions. Traffic modeling results are reported using Synchro's Highway Capacity Manual (HCM) results using the latest edition able to provide operations information at each signalized intersection.¹

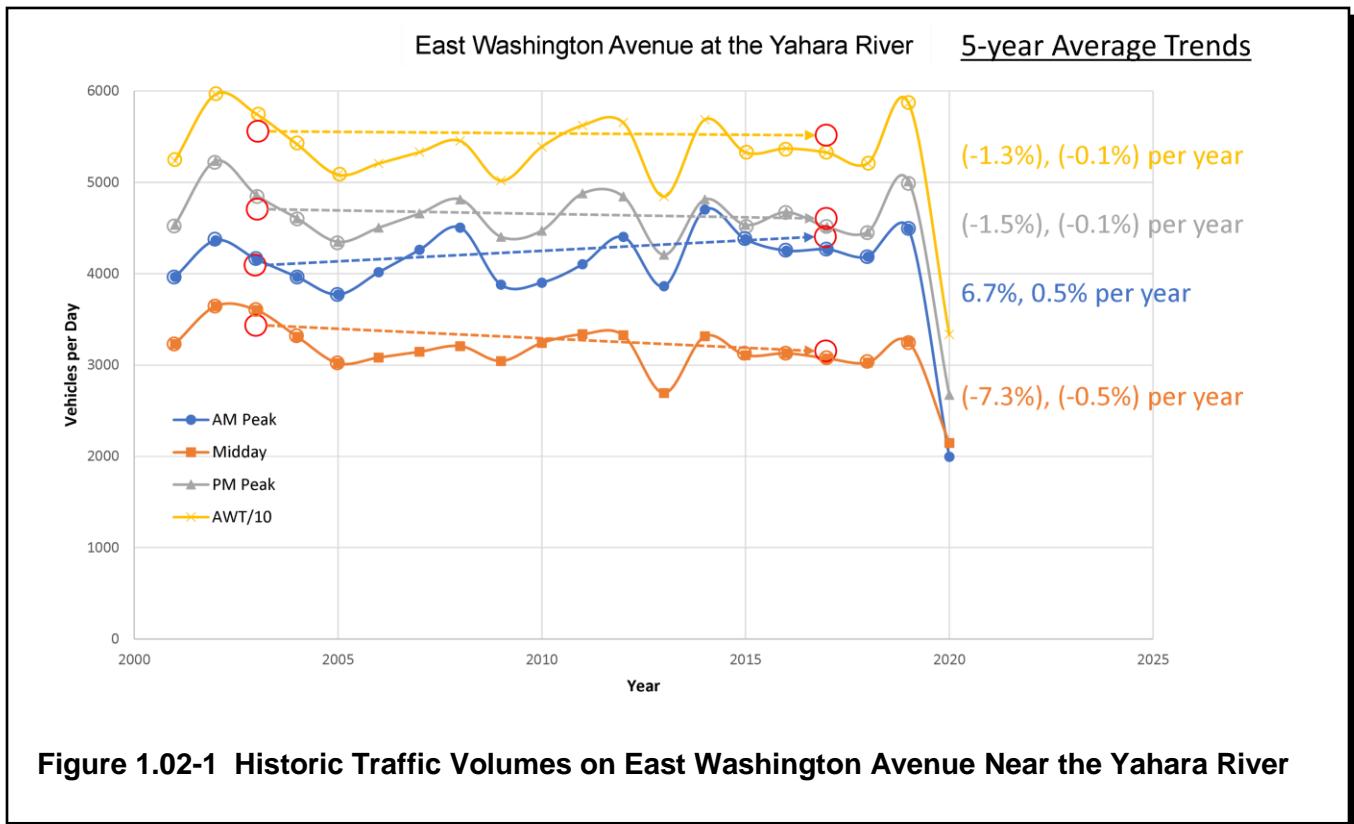

WisDOT staff and their representatives reviewed and provided comments on this report. The comments along with BRT team replies are included in Appendix G.

¹Signals using standard National Electrical Manufacturers Association (NEMA) eight-phase operation are reported using HCM 6th Edition, those that do not are reported using HCM2000.

A. Traffic Volumes

The traffic volumes used in this analysis are primarily from StreetLight data for the 2019 calendar year, Monday through Friday, excluding holidays. The project team compared the StreetLight data to the traffic volumes in the City-supplied Base Conditions traffic models (representing approximately 2016 to 2018 traffic assembled from multiple sources) as a check. For 21 of the 762 turning movements across all three peak hours (less than 3 percent), it appears the StreetLight data is erroneous (missing or unreasonable values compared to the City model values, nearby intersections, and/or familiarity with corridor conditions) and for these movements the turning movement value from the City-provided models was used. The team also flagged locations where the StreetLight data was 30 percent higher or lower than the City provided volumes and used the average of the StreetLight volumes and the City provided volume at those locations. Overall, the StreetLight data was consistent with the City-supplied data for over 90 percent of the turning movements in each of the three peak hours. Appendix A provides the traffic volume set used in this analysis.

The Base Conditions models represent 2024 without BRT (existing conditions) and with BRT service. The project team did not apply growth factors to the 2019 volume set to reach a 2024 condition because the 2019 data represents pre-COVID volumes and traffic currently remains below 2019 levels. Furthermore, historic counts along East Washington Avenue have shown essentially zero growth over approximately the past 15 years, despite significant infill redevelopment directly on the corridor. It is therefore reasonable to assume the 2019 volume set is representative of conditions in 2024. Figure 1.02-1 shows the traffic volumes and five-year average growth rates for 2001 to 2005 and 2014 to 2019 based on data from the Wisconsin Department of Transportation's (WisDOT's) Automated Traffic Recorder located on US 151/East Washington Avenue near the Yahara River bridge. Only the AM peak hour shows modest traffic growth of 0.5 percent per year. The midday and PM peak hours and Average Weekday Traffic (AWT) had lower five-year average volumes from 2015 to 2019 compared to 2001 to 2005.

At the request of WisDOT staff, in addition to the 2024 conditions, a sensitivity analysis was completed using a higher volume set. The Dane County Travel Demand Model (TDM) forecasts traffic growth on US 151/East Washington to grow at 0.94 percent per year between 2010 and 2050. This traffic analysis also includes a future conditions analysis based on applying a linear growth rate of 0.94 years for ten years, or 109.4 percent of the 2024 traffic volumes.

B. Peak Periods used for Analysis

The proposed peak period parking lane usage and general purpose traffic allowance in the bus lanes described above are anticipated to occur westbound/inbound from 7 to 9 A.M. and eastbound/outbound from 4 to 6 P.M. The traffic analysis summarized in this report uses the following timeframes:

1. AM peak hour: 7 to 8 A.M.
2. Noon hour: 12 to 1 P.M.
3. PM peak hour: 4 to 5 P.M.

Figure 1.02-2 shows Automatic Traffic Recorder (ATR) data on US 151/East Washington Avenue near the Yahara River bridge and confirms both the proposed timeframes for the peak direction lane usage adjustments and the three individual hours used in the traffic modeling.

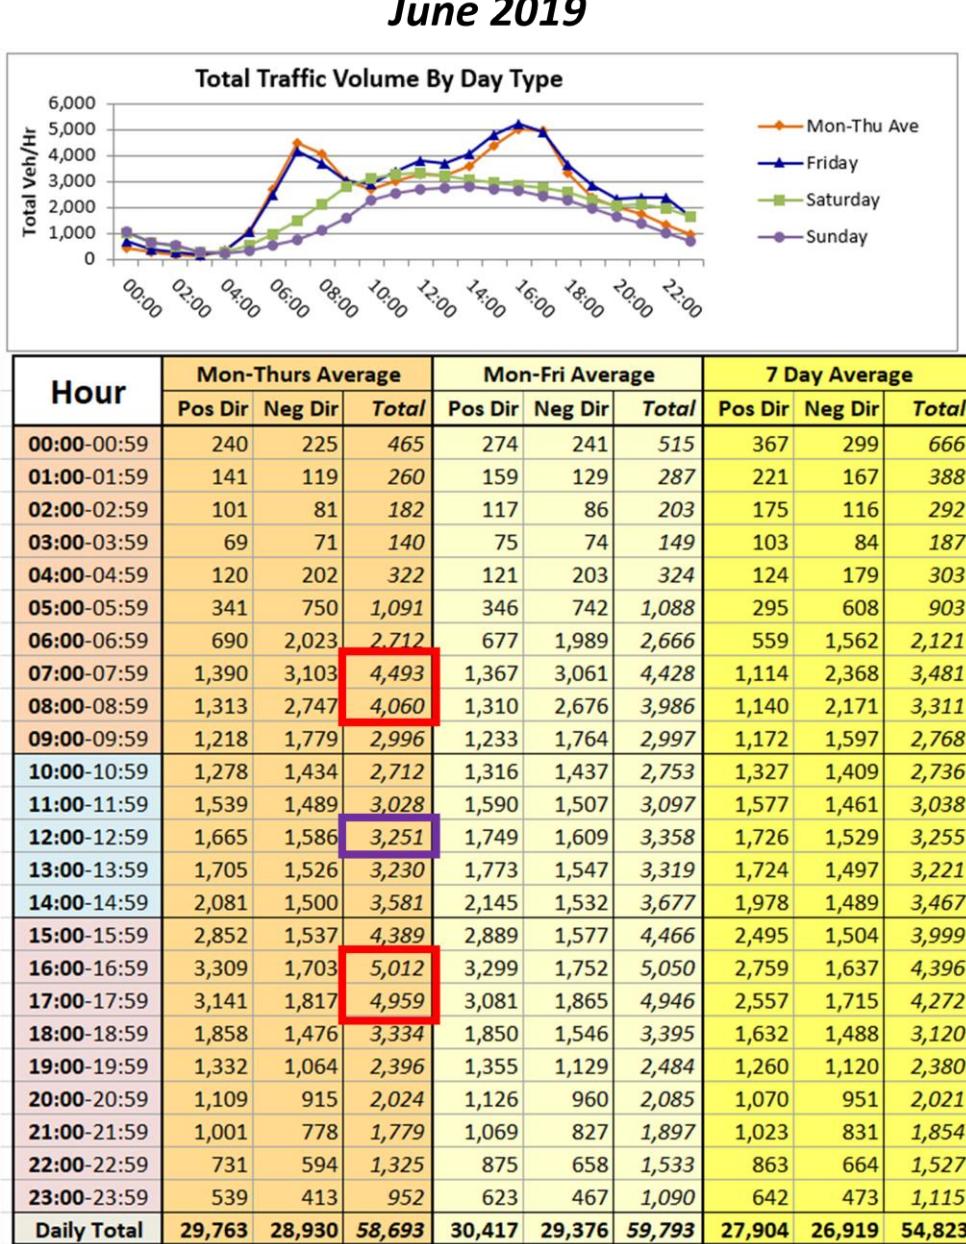

Figure 1.02-2 Hourly Traffic Volumes on East Washington Avenue near the Yahara River

C. Left-Turn Restriction Volume Redistribution

The project team used the following assumptions regarding how drivers will choose to complete a substitute maneuver to the left turns that are eliminated:

- 50 percent turn left at the closest upstream signal (if possible, otherwise downstream).
- 30 percent turn left at the closest downstream signal (if possible, otherwise upstream).

- 20 percent use a different route or use an unsignalized intersection for a left-turn or U-turn (not modeled).

D. Traffic Modeling Assumptions

In early 2020 in response to COVID, TE staff installed pedestrian phase recall for all approaches at the signals along US 151/East Washington Avenue (meaning pedestrian phases for all crosswalks are called/displayed during every signal cycle). Strand Associates, Inc® (Strand) staff updated the pedestrian recall settings in the models based on coordination with TE staff and the current best estimate of which locations will continue to use pedestrian recall versus those that will return to pedestrian actuated operation, summarized as follows:

- Livingston Street to Baldwin Street: all pedestrian phases on recall.
- First Street: actuated pedestrian operation.
- Fourth Street: pedestrian recall in the AM peak hour only (to accommodate school students).
- Sixth Street and intersection to the east: actuated pedestrian operation.

The proposed conditions (with BRT) models use the same traffic volumes with optimized traffic signal timings and splits. This is intended to represent conditions at the time BRT service is initiated in 2024. There are two new signals proposed to provide pedestrian access to BRT stations: Melvin Court and Independence Lane. In addition, at station locations where the East Washington Avenue left-turn movements will be offset from oncoming through traffic more than they are currently or a station is located on the other side of the intersection and the visibility will be challenging, the left-turn phasing is modeled as protected-only. The project team allowed Synchro 11 to optimize lead versus lag protected-only left-turn phasing. These locations include:

- Paterson Street westbound left turn
- Baldwin Street westbound left-turn lane
- First Street westbound left-turn lane
- Fourth Street eastbound left-turn
- Milwaukee Street/North Street eastbound left-turn lane
- Marquette Street westbound left-turn lane
- Melvin Court westbound left-turn lane

SECTION 2

TRAFFIC ANALYSIS RESULTS

2.01 OPERATIONAL GOALS

The WisDOT Facilities Development Manual (FDM) Chapter 11, Section 5, Subsection 3.2.1 indicates the desirable motor vehicle Level of Service (LOS) is LOS D for US 151/East Washington Avenue because it is a National Highway System (NHS) route.

Additionally, both WisDOT and the Federal Highway Administration (FHWA) seek to provide bicycle accommodations on key routes. The Greater Madison Metropolitan Planning Organization (GMMPO) uses bicycle LTS to understand the degree to which bicycles are accommodated on and along streets¹. Bicycle LTS is a rating given to a road segment or crossing indicating the traffic stress it imposes on bicyclists. LTS ranges from 1 to 4 as follows:

- LTS 1: Strong separation from all except low speed, low volume traffic. Suitable for children.
- LTS 2: Except in low speed, low volume traffic situations, cyclists have their own place to ride that keeps them from having to interact with traffic except at formal crossings. Physical separation from higher speed and multilane traffic. Crossings that are easy for an adult to navigate. Corresponds to design criteria for Dutch bicycle route facilities. A LTS that most adults can tolerate, particularly those sometimes classified as “interested but concerned”.
- LTS 3: Involves interaction with moderate speed or multilane traffic, or close proximity to higher speed traffic. A LTS acceptable to those classified as “enthused and confident”.
- LTS 4: Involves interaction with higher speed traffic or close proximity to high speed traffic. A LTS acceptable only to those classified as “strong and fearless”.

The City seeks to provide low levels of traffic stress on City streets.

2.02 2024 CONDITIONS

A. Base Conditions (Without BRT Service)

Appendix B provides the HCM reports from Synchro11 for the 2024 Base Conditions (without BRT service). The traffic modeling indicates US 151/East Washington Avenue will operate at LOS D or better for most intersection movements in 2024 without BRT service. The movements that operate at LOS E and LOS F on US and state highway intersection approaches (US 151, WIS 113, and WIS 30) are summarized in the following. Those that represent United States (US) or state highway *route movements* are shown in **bold** text.

1. AM Peak Hour

a. LOS E Movements (six total)

(1) Blair Street: northbound left

¹ <http://www.northeastern.edu/pe-ter.furth/research/level-of-traffic-stress/>, accessed July 21, 2021

- (2) Baldwin Street: eastbound left,
 - (3) First Street: **eastbound left**
 - (4) First Street: **southbound left**
 - (5) Eagan Road/Continental Lane: westbound left
 - (6) Zeier Road: eastbound left
- b. LOS F movements (three total)
- (1) First Street: southbound through
 - (2) Fourth Street: eastbound left
 - (3) Milwaukee Street/North Street: **westbound through**
2. Noon Hour
- a. LOS E Movements (three total)
- (1) First Street: **eastbound left**
 - (2) Thierer Road/Portage Road: eastbound left
 - (3) East Springs Drive: westbound left
- b. LOS F Movements (three total)
- (1) First Street: **southbound left**
 - (2) Zeier Road: eastbound left
 - (3) Zeier Road: westbound left
3. PM Peak Hour
- a. LOS E movements (three total)
- (1) Johnson Street: westbound left
 - (2) Zeier Road: eastbound left
 - (3) Zeier Road: westbound left

- b. LOS F Movements (ten total)
 - (1) Blair Street: northbound left
 - (2) Blair Street: **northbound right**
 - (3) Livingston Street: westbound left
 - (4) Ingersoll Street: **eastbound through**
 - (5) Baldwin Street: **eastbound through**,
 - (6) First Street: **eastbound through**
 - (7) First Street: **westbound right**
 - (8) First Street: **southbound left**
 - (9) Fourth Street: **eastbound through**
 - (10) Milwaukee Street/North Street: **eastbound through**

In 2024 without BRT service, bicycle accommodations are provided for the length of the corridor 24 hours per day. The bicycle LTS along East Washington Avenue from Blair Street to Marquette Street ranges from 2.0 to 2.5.

B. BRT Conditions

Appendix C provides the HCM reports from Synchro11 for the 2024 BRT Conditions. The traffic modeling indicates US 151/East Washington Avenue will operate at LOS D or better for most intersection movements in 2024 with BRT service. The movements that operate at LOS E and LOS F on US and state highway intersection approaches (US 151, WIS 113, and WIS 30) are summarized in the following. Those that represent US or state highway *route movements* are shown in **bold** text.

- 1. AM Peak Hour
 - a. LOS E Movements (13 total)
 - (1) Paterson Street: westbound left
 - (2) Baldwin Street: westbound left
 - (3) First Street: **eastbound left**
 - (4) First Street: westbound left

- (5) First Street: westbound through
 - (6) First Street: **southbound left**
 - (7) Milwaukee Street/North Street: eastbound left
 - (8) Rethke Avenue/Melvin Court: eastbound left
 - (9) Rethke Avenue/Melvin Court: westbound left
 - (10) Fair Oaks Avenue/Wright Street: eastbound left
 - (11) Eagan Road/Continental Avenue: westbound left
 - (12) Independence Lane: eastbound left
 - (13) Zeier Road: eastbound left
- b. LOS F movements (five total)
- (1) Blair Street: northbound left
 - (2) First Street: southbound through
 - (3) Fourth Street: eastbound left
 - (4) Fourth Street: **westbound through**
 - (5) Westbound WIS 30 Ramps: eastbound left
2. Noon Hour
- a. LOS E Movements (13 total)
- (1) Blair Street: northbound left
 - (2) Paterson Street: westbound left
 - (3) First Street: **eastbound left**
 - (4) First Street: westbound left
 - (5) First Street: **southbound left**
 - (6) Fourth Street: eastbound left

- (7) Milwaukee Street/North Street: eastbound left
 - (8) Eastbound WIS 30 Ramps: **westbound left**
 - (9) Rethke Avenue/Melvin Court: eastbound left
 - (10) Rethke Avenue/Melvin Court: westbound left
 - (11) Fair Oaks Avenue/Wright Street: eastbound left
 - (12) Fair Oaks Avenue/Wright Street: westbound left
 - (13) Eagan Road/Continental Avenue: eastbound left
- b. LOS F movements (one total)
- (1) Baldwin Street: westbound left
3. PM Peak Hour
- a. LOS E Movements (nine total)
- (1) First Street: **eastbound left**
 - (2) First Street: westbound left
 - (3) First Street: southbound through
 - (4) Milwaukee Street/North Street: eastbound left
 - (5) Eastbound WIS 30 Ramps: **westbound left**
 - (6) Rethke Avenue/Melvin Court: eastbound left
 - (7) Rethke Avenue/Melvin Court: westbound left
 - (8) Fair Oaks Avenue/Wright Street: eastbound left
 - (9) Zeier Road: westbound left
- b. LOS F Movements (11 total)
- (1) Blair Street: northbound left
 - (2) Blair Street: **northbound right**

- (3) Livingston Street: westbound left
- (4) Paterson Street: **eastbound through**
- (5) Paterson Street: westbound left
- (6) Ingersoll Street: **eastbound through**
- (7) Baldwin Street: **eastbound through**
- (8) Baldwin Street: westbound left
- (9) First Street: **eastbound through**
- (10) First Street: **southbound left**
- (11) Marquette Street: westbound left

In 2024 with the proposed BRT service and associated lane usage, the LTS along East Washington Avenue from Blair Street to Marquette Street ranges from 2.0 to 2.5 during the off-peak periods. The LTS is 4.0 during the peak periods in the peak directions due to allowing general purpose motor vehicle travel in the shared parking/bike lane.

C. Comparison of 2024 Conditions

Table 2.02-1 compares the number of US and state highway approach movements that operate at LOS E or LOS F without and with BRT service in 2024.

Time Period	Operations	Base Conditions (approach movements)	With BRT (approach movements)
AM Peak Hour	LOS E	6	13
	LOS F	3	5
Noon Hour	LOS E	3	13
	LOS F	3	1
PM Peak Hour	LOS E	3	8
	LOS F	10	11

Table 2.02-1 2024 US and State Highway Intersection Approach Operations Comparison

In general, operations in 2024 with BRT in service are similar to the Base Conditions. There is some congestion and queuing along US 151/East Washington Avenue in either scenario. Adding the BRT service combined with optimizing signal cycle lengths, phasing, and coordination scenarios results in a

higher number of LOS E movements but a similar number of LOS F results on the US and state highway intersection *approaches*.

Notably, the number of US and state highway *route movements* that operate at LOS F is the same or higher without the BRT service than with BRT service and optimized signal settings for all three peak hours: one versus one in the AM peak hour; one versus none in the noon hour; and eight versus six in the PM peak hour.

In 2024 without BRT service, bicycle accommodations are provided for the length of the corridor 24 hours per day. The bicycle LTS along East Washington Avenue from Blair Street to Marquette Street ranges from 2.0 to 2.5. With the proposed BRT service and associated lane usage the LTS along East Washington Avenue from Blair Street to Marquette Street continues to range from 2.0 to 2.5 during the off-peak periods. The LTS is 4.0 during the peak periods in the peak directions due to allowing general purpose motor vehicle travel in the shared parking/bike lane.

2.03 2034 CONDITIONS

A. Base Conditions (Without BRT Service)

Appendix D provides the HCM reports from Synchro11 for the 2034 Base Conditions (without BRT service). The traffic modeling indicates US 151/East Washington Avenue will operate at LOS D or better for most intersection movements in 2034 without BRT service. The movements that operate at LOS E and LOS F on US and state highway intersection approaches (US 151, WIS 113, and WIS 30) are summarized in the following. Those that represent US or state highway *route movements* are shown in **bold** text.

1. AM Peak Hour

- a. LOS E Movements (six total)
 - (1) Blair Street: northbound left
 - (2) First Street: **westbound through**
 - (3) First Street: **southbound left**
 - (4) Westbound WIS 30 Ramps: **southbound right**
 - (5) Eagan Road/Continental Lane: westbound left
 - (6) Zeier Road: eastbound left
- b. LOS F Movements (seven total)
 - (1) Baldwin Street: eastbound left

- (2) Baldwin Street: **westbound through**
 - (3) First Street: eastbound left
 - (4) First Street: southbound through
 - (5) Fourth Street: eastbound left
 - (6) Fourth Street: **westbound through**
 - (7) Milwaukee Street: **westbound through**
2. Noon hour
- a. LOS E movements (two total)
 - (1) Blair Street: northbound left
 - (2) Thierer Road/Portage Road: eastbound left
 - b. LOS F movements (three total)
 - (1) First Street: **southbound left**
 - (2) Zeier Road: eastbound left
 - (3) Zeier Road: westbound left
3. PM Peak Hour
- a. LOS E movements (seven total)
 - (1) Blair Street: **westbound left**
 - (2) Livingston Street: westbound left
 - (3) Johnson Street: westbound left
 - (4) Marquette Street: **eastbound through**
 - (5) Eagan Road/Continental Lane: **eastbound through**
 - (6) Zeier Road: eastbound left
 - (7) Zeier Road: westbound left

- b. LOS F Movements (13 total)
 - (1) Blair Street: northbound left
 - (2) Blair Street: **northbound right**
 - (3) Paterson Street: **eastbound through**
 - (3) Paterson Street: westbound left
 - (5) Ingersoll Street: **eastbound through**
 - (6) Baldwin Street: **eastbound through**
 - (7) First Street: **eastbound through**
 - (8) First Street: **westbound right**
 - (9) First Street: **southbound left**
 - (10) Fourth Street: **eastbound through**
 - (11) Sixth Street: **eastbound through**
 - (12) Milwaukee Street/North Street: **eastbound through**
 - (13) Milwaukee Street/North Street: southbound through

In 2034 without BRT service, bicycle accommodations are provided for the length of the corridor 24 hours per day. The bicycle LTS along East Washington Avenue from Blair Street to Marquette Street ranges from 2.0 to 2.5.

B. BRT Conditions

Appendix E provides the HCM reports from Synchro11 for the 2034 BRT Conditions. The traffic modeling indicates US 151/East Washington Avenue will operate at LOS D or better for most intersection movements in 2034 with BRT service. The movements that operate at LOS E and LOS F on US and state highway intersection approaches (US 151, WIS 113, and WIS 30) are summarized in the following. Those that represent US or state highway route *movements* are shown in **bold** text.

- 1. AM Peak Hour
 - a. LOS E Movements (14 total)
 - (1) Blair Street: northbound left

- (2) Paterson Street: westbound left
 - (3) Baldwin Street: westbound left
 - (4) Baldwin Street: **westbound through**
 - (5) First Street: **eastbound left**
 - (6) First Street: westbound left
 - (7) First Street: **southbound left**
 - (8) Milwaukee Street/North Street: eastbound left
 - (9) WIS 30 Eastbound Ramps: **westbound left**
 - (10) Rethke Avenue/Melvin Court: eastbound left
 - (11) Rethke Avenue/Melvin Court: westbound left
 - (12) Fair Oaks Avenue/Wright Street: eastbound left
 - (13) Independence Lane: eastbound left
 - (14) Zeier Road: eastbound left
- b. LOS F Movements (four total)
- (1) First Street: **westbound through**
 - (2) First Street: southbound through
 - (3) Fourth Street: eastbound left
 - (4) Fourth Street: **westbound through**
2. Noon hour
- a. LOS E movements (eight total)
- (1) Blair Street: northbound left
 - (2) First Street: **eastbound left**
 - (3) First Street: westbound left
 - (4) First Street: **southbound left**

- (5) Fourth Street: eastbound left
 - (6) Milwaukee Street/North Street: eastbound left
 - (7) Johnson Street: westbound left
 - (8) Eagan Road/Continental Lane: eastbound left
 - b. LOS F Movements (two total)
 - (1) Paterson Street: westbound left
 - (2) Baldwin Street: westbound left
3. PM Peak Hour
- a. LOS E Movements (13 total)
 - (1) First Street: **eastbound left**
 - (2) First Street: **westbound through**
 - (3) Fourth Street: eastbound left
 - (4) Milwaukee Street/North Street: eastbound left
 - (5) Milwaukee Street/North Street: **eastbound through**
 - (6) Eastbound WIS 30 Ramps: westbound left
 - (7) Rethke Avenue/Melvin Court: eastbound left
 - (8) Rethke Avenue/Melvin Court: westbound left
 - (9) Fair Oaks Avenue/Wright Street: eastbound left
 - (10) Fair Oaks Avenue/Wright Street: westbound left
 - (11) Independence Lane: eastbound left
 - (12) Zeier Road: westbound left
 - (13) East Springs Drive: westbound left
 - b. LOS F Movements (17 total)
 - (1) Blair Street: northbound left

- (2) Blair Street: **northbound right**
- (3) Livingston Street: westbound left
- (4) Paterson Street: **eastbound through**
- (5) Paterson Street: westbound left
- (6) Ingersoll Street: **eastbound through**
- (7) Baldwin Street: **eastbound through**
- (8) Baldwin Street: westbound left
- (9) First Street: **eastbound through**
- (10) First Street: westbound left
- (11) First Street: **southbound left**
- (12) First Street: southbound through
- (13) Fourth Street: **eastbound through**
- (14) Sixth Street: **eastbound through**
- (15) Marquette Street: westbound left
- (16) Independence Lane: **eastbound through**
- (17) Independence Lane: eastbound right

In 2034 with the proposed BRT service and associated lane usage, the LTS along East Washington Avenue from Blair Street to Marquette Street ranges from 2.0 to 2.5 during the off-peak periods. The LTS is 4.0 during the peak periods in the peak directions due to allowing general purpose motor vehicle travel in the shared parking/bike lane.

C. Comparison of 2034 Conditions

Table 2.03-1 compares the number of US and state highway approach movements that operate at LOS E or LOS F without and with BRT service in 2034.

Time Period	Operations	Base Conditions (approach movements)	With BRT (approach movements)
AM Peak Hour	LOS E	6	14
	LOS F	7	4
Noon Hour	LOS E	2	8
	LOS F	3	2
PM Peak Hour	LOS E	7	13
	LOS F	12	17

Table 2.03-1 2034 US and State Highway Intersection Approach Operations Comparison

In general, operations in 2034 with BRT in service results in more movements on US and state highway *approaches* experiencing LOS E and LOS F operations compared to Base Conditions without BRT service.

Notably, the number of US and state highway *route movements* that operate at LOS F is higher without the BRT service versus with BRT service for all three peak hours: three versus two in the AM peak hour; one versus none in the noon hour; and ten versus nine in the PM peak hour.

The 2034 sensitivity analysis for motor vehicle traffic documented in this report applies a 0.94 percent annual growth rate over ten years at WisDOT's request. This represents more traffic volume growth from 2024 to 2034 than occurred from the early 2000s through 2019. The City agrees to monitor traffic volumes and operations along US 151/East Washington Avenue and coordinate with WisDOT to evaluate the need for and timing of any adjustments to BRT and general purpose time-of-day lane usage.

In 2034 without BRT service, bicycle accommodations are provided for the length of the corridor 24 hours per day. The bicycle LTS along East Washington Avenue from Blair Street to Marquette Street ranges from 2.0 to 2.5. With the proposed BRT service and associated lane usage the LTS along East Washington Avenue from Blair Street to Marquette Street continues to range from 2.0 to 2.5 during the off-peak periods. The LTS is 4.0 during the peak periods in the peak directions due to allowing general purpose motor vehicle travel in the shared parking/bike lane.

SECTION 3
SUMMARY OF ADDITIONAL WISDOT INQUIRIES

3.01 SUMMARY OF ADDITIONAL WISDOT INQUIRIES

For the majority of all movements in the models, the traffic modeling suggests that implementing BRT service by prohibiting the left-turn movements and providing the proposed bus-only lane configurations while also optimizing the signal timings and splits essentially maintains (or potentially improves) operations at the East Washington Avenue traffic signals, particularly with the 2024 volumes set.

WisDOT Southwest Region staff requested the following information related to the traffic modeling for the proposed BRT service.

A. Provide Motor Vehicle Capacity Analysis for the Off-Peak Lane Reductions

Table 3.01-1 summarizes the US 151 movements in the off-peak direction where general purpose lane reductions are proposed to accommodate BRT service using the 2024 volume set. With the proposed BRT lane configurations, the shared parking and bicycle lane remains in use in the off-peak directions. The table rows represent the following movements:

1. Eastbound (off-peak direction in the AM peak and noon hours):
 - a. Northbound right-turn
 - (1) Blair Street
 - b. Eastbound through
 - (1) Livingston Street
 - (2) Paterson Street
 - (3) Ingersoll Street
 - (4) Baldwin Street
 - (5) First Street
 - (6) Fourth Street
 - (7) Sixth Street
 - (8) Milwaukee Street/North Street
 - (9) Johnson Street
 - (10) Marquette Street
 - (11) WIS 30 Eastbound Ramps
 - (12) WIS 30 Westbound Ramps
 - (13) Melvin Court
 - (14) Fair Oaks Avenue/Wright Street
 - (15) Eagan Road/Continental Lane
 - (16) Independence Lane
 - (17) Zeier Road

2. Westbound (off-peak direction in the noon and PM peak hours):

a. Westbound through

- (1) Zeier Road
- (2) Independence Lane
- (3) Eagan Road/Continental Lane
- (4) Fair Oaks Avenue/Wright Street
- (5) Melvin Court
- (6) WIS 30 Westbound Ramps
- (7) WIS 30 Eastbound Ramps
- (8) Marquette Street
- (9) Johnson Street
- (10) Milwaukee Street/North Street
- (11) Sixth Street
- (12) Fourth Street
- (13) First Street
- (14) Baldwin Street
- (15) Ingersoll Street
- (16) Paterson Street
- (17) Livingston Street

b. Westbound left-turn

- (1) Blair Street

Time Period	Operations	Base Conditions	With BRT
AM Peak Hour (Eastbound)	LOS E	0	0
	LOS F	0	0
	v/c > 0.95	0	0
Noon Hour (Eastbound)	LOS E	0	0
	LOS F	0	0
	v/c > 0.95	0	0
Noon Hour (Westbound)	LOS E	0	0
	LOS F	0	0
	v/c > 0.95	0	0
PM Peak Hour (Westbound)	LOS E	0	0
	LOS F	0	0
	v/c > 0.95	0	1*

*Westbound through at First Street (0.96)

v/c=volume to capacity

Table 3.01-1 2024 Off-Peak Direction Operations Comparison

The only intersection with marginal operations in the off-peak direction with the proposed general purpose lane reduction is First Street westbound during the PM peak hour. The westbound through movement operates at LOS D with an average of 53.7 seconds of delay per vehicle and a v/c ratio of 0.96.

These types of conditions for motor vehicle traffic are not out of character for the US 151/East Washington Avenue corridor in general, particularly in the peak inbound AM and outbound PM directions. The project team proposes that this is a reasonable tradeoff for providing a dedicated bus lane for BRT service as well as an on-street bicycle accommodation (shared with the on-street parking) for 22 hours of the day.

B. Provide Motor Vehicle Operations and Safety Analysis for the Left-Turn Restrictions

1. Operations Analysis

Table 3.01-2 summarizes the operations at signalized intersections that may receive additional left-turn traffic because of the proposed left-turn restrictions that allow space for center stations on US 151/East Washington Avenue based on the following redistribution assumptions:

- a. 50 percent turn left at the closest upstream signal (if possible, otherwise downstream).
- b. 30 percent turn left at the closest downstream signal (if possible, otherwise upstream).
- c. 20 percent use a different route or use an unsignalized intersection for a left turn or U-turn (not modeled).

Intersections receiving additional left-turn traffic include:

- a. Ingersoll Street eastbound left
- b. First Street eastbound left and westbound left
- c. Sixth Street westbound left
- d. Marquette Street westbound left
- e. Wright Street eastbound left

Time Period	Operations	Base Conditions	With BRT
AM Peak Hour	Ingersoll Street Eastbound Left	LOS A	LOS B
	First Street Eastbound Left	LOS E	LOS E
	First Street Westbound Left	LOS A	LOS E
	Marquette Street Westbound Left	LOS A	LOS D
	Wright Street Eastbound Left	LOS D	LOS E
Noon Hour	Ingersoll Street Eastbound Left	LOS A	LOS A
	First Street Eastbound Left	LOS E	LOS E
	First Street Westbound Left	LOS A	LOS E
	Marquette Street Westbound Left	LOS A	LOS A
	Wright Street Eastbound Left	LOS D	LOS E
PM Peak Hour	Ingersoll Street Eastbound Left	LOS A	LOS A
	First Street Eastbound Left	LOS D	LOS E
	First Street Westbound Left	LOS D	LOS E
	Marquette Street Westbound Left	LOS D	LOS F
	Wright Street Eastbound Left	LOS D	LOS E

Table 3.01-2 2024 Intersections Receiving Additional Left-Traffic Turn Traffic Operations Comparison

While the left turns that receive additional traffic experience higher delay, none of them operate with a volume to capacity ratio that exceeds 1.0. The westbound left at Marquette Street drops just into the LOS F range during the PM peak hour with 86.9 seconds of delay per vehicle and a volume to capacity ratio of 0.86. Observation of the SimTraffic simulation does not suggest the westbound left operations or queuing are of concern for westbound US 151/East Washington Avenue traffic.

2. Safety Analysis

Based on the operations results, the project team does not foresee safety concerns associated with the left-turn restrictions and the redistributed traffic causing undue congestion. None of the left-turn movements receiving traffic are predicted to exceed the movement capacity. Also, the local street system nearby is a grid, providing multiple route options for the redistributed traffic which should help disperse it relatively quickly moving away from the US 151/East Washington Avenue corridor.

Some drivers may elect to perform a downstream U-turn maneuver in lieu of one of the restricted left-turn movements; however, U-turns are generally allowed on US 151/East Washington Avenue today and the City has not identified any safety concerns associated with them. The City provided crash summary information indicating the percentage of crashes that were labeled as U-turn related from 2015 through 2019 was 0.46 percent. The peer corridors of University Avenue, Fish Hatchery Road, Park Street, and Stoughton Road had U-turn crash percentages ranging from 0.19 to 0.58 percent over the same time frame, though it is worth noting that the number of intersections where U-turns are allowed, the number of opposing through lanes, and overall corridor lengths vary across these streets.

Based on the above, as well as the generally accepted premise that alternatives to left-turn movements tend to provide capacity and safety benefits (such as the quadrant intersection and Michigan u-turn designs), the project team does not foresee safety concerns associated with restricting the relatively low-volume left-turn movements at select center/median station locations.

C. Provide Operations Analysis for Blair Street, First Street, Mendota Street, Portage Road, and East Springs Drive

Full reports for these intersections are provided in Appendices B through E. Following is a more detailed summary of the 2024 modeling results for each location.

1. Blair Street

a. AM Peak Hour

Modest congestion and queuing occur at Blair Street in the Base Conditions (without BRT) but all movements operate at LOS D or better except the northbound left, which is just into the LOS E range at 57.9 seconds per vehicle. The overall intersection operates at LOS C with 24.0 seconds of delay per vehicle.

When BRT service is added the northbound left movement drops to LOS F with 102.8 seconds of delay per vehicle but operates below capacity with a v/c ratio of 0.87. The southbound left movement drops just into LOS E operations but has a low v/c ratio of 0.54. The other movements remain at LOS D or better and the overall intersection operates well at LOS B with 14.1 seconds of delay per vehicle.

b. Noon Hour

Modest congestion and queuing occur at Blair Street in the Base Conditions (without BRT) with all movements operating at LOS D or better. The overall intersection operates at LOS C with 23.7 seconds of delay per vehicle.

When BRT service is added and the signal timings, phasing, and coordination is optimized, all movements operate at LOS D or better, except the northbound left, which operates just into the LOS E range with 56.8 seconds of delay per vehicle and a low v/c

ratio of 0.47. The overall intersection operates at LOS C with 25.0 seconds of delay per vehicle.

c. PM Peak Hour

Congestion and queuing occur at Blair Street in the Base Conditions (without BRT). The northbound right (US 151) operates at LOS F with 125.3 seconds of delay per vehicle and a v/c ratio of 1.15. The non-US/state route eastbound through and northbound left movements also operate at LOS F, and the southbound left movement operates at LOS E. The overall intersection operates at LOS E with 70.3 seconds of delay per vehicle.

Congestion and queuing remain at Blair Street when BRT is in service. The optimized signal timings provide similar operations for the northbound right (US 151) movement operating at LOS F with 113.7 seconds of delay per vehicle and a v/c ratio of 1.13. The non-US/state route eastbound through and northbound left movements also operate at LOS F and the southbound left movement operates at LOS E. The overall intersection operations drop to LOS F with 141.1 seconds of delay per vehicle because of the eastbound through movement general purpose lane reduction from three to two.

Observation of SimTraffic microsimulation suggests similar northbound (US 151) queue lengths without versus with BRT service. SimTraffic reports averaging the results from nine simulation runs indicate modestly longer northbound queue lengths without BRT (average length 640 to 660 feet and 95th percentile length 1,030 to 1,070-feet) versus with BRT (average length 580 to 590 feet and 95th percentile length 920 to 950-feet). The eastbound queuing does worsen with the BRT service converting one of the three existing eastbound general purpose lanes to bus only, but City staff have reviewed this and are comfortable with these conditions considering the context adjacent to the Capitol Square and Capitol Loop in the City's downtown area.

2. First Street

a. AM Peak Hour

Congestion and queuing occur at First Street in the Base Conditions (without BRT). The eastbound left and southbound left operate at LOS E while the southbound through operates at LOS F with a v/c ratio of 0.89. The inbound/westbound through movement operates at LOS D but the v/c ratio is 1.10. The overall intersection operates at LOS D with 44.5 seconds of delay per vehicle.

When BRT service is added and the signal timings are optimized, the eastbound left, westbound left, westbound through, and southbound left operate at LOS E. The left turns have v/c ratios of 0.66 or less, while the inbound/westbound through has a v/c ratio of 1.07 (slightly better than Base Conditions). The overall intersection operates at LOS E with 60.4 seconds of delay per vehicle.

b. Noon Hour

Modest congestion and queuing occur at First Street in the Base Conditions (without BRT) with all movements operating at LOS D or better, except the eastbound left (LOS E with 65.5 seconds of delay per vehicle and a v/c ratio of 0.66) and the southbound left (LOS F with 103.6 seconds of delay per vehicle and a v/c ratio of 0.98). The overall intersection operates at LOS B with 17.0 seconds of delay per vehicle.

When BRT service is added and the signal timings, phasing, and coordination is optimized all movements operate at LOS D or better except the eastbound left (LOS E with 56.3 seconds of delay per vehicle and a v/c ratio of 0.67), the westbound left (LOS E with 58.1 seconds of delay and a v/c ratio of 0.52) and the southbound left (LOS E with 69.5 seconds of delay per vehicle and a v/c ratio of 0.81). The overall intersection operates at LOS C with 33.0 seconds of delay per vehicle.

c. PM Peak Hour

Congestion and queuing occurs at First Street in the Base Conditions (without BRT), with three movements operating at LOS F: the eastbound through with a v/c of 1.30; the westbound right with a v/c of 0.09; and the southbound left with a v/c of 1.02. The overall intersection operates at LOS F with 102.4 seconds of delay per vehicle.

Congestion and queuing remain at First Street when BRT is in service. There are three movements that operate at LOS E: the eastbound left with a v/c ratio of 0.76; the westbound left with a v/c ratio of 0.59; and the southbound through with a v/c ratio of 0.74. The eastbound through operates at LOS F with a v/c of 1.27. The southbound left operates at LOS F with a v/c ratio of 1.19. The overall intersection operations are similar at LOS F with 105.9 seconds of delay per vehicle.

Observation of SimTraffic microsimulation shows similar operations without BRT compared to with BRT. In either case, despite the poor LOS and high v/c ratios predicted by HCS for the eastbound through movement, traffic in the simulation is nearly always accommodated in one signal cycle (cycle failures are rare and do not appear more frequent when BRT service is added).

3. Mendota Street

a. AM Peak Hour

Congestion and queuing are low at Mendota Street in the Base Conditions (without BRT) with all movements operating at LOS D or better. The overall intersection operates at LOS A with 4.8 seconds of delay per vehicle.

Adding BRT service does not change the intersection geometry. Eastbound BRT buses make a southbound left turn on to US 151/East Washington Avenue via the regular signal phase, while westbound BRT buses make a westbound right turn on to Mendota Street.

The modeling indicates all movements operate at LOS D or better and the overall intersection operates at LOS A with 5.0 seconds of delay.

b. Noon Hour

Congestion and queuing are low at Mendota Street in the Base Conditions (without BRT) with all movements operating at LOS D or better. The overall intersection operates at LOS A with 8.0 seconds of delay per vehicle.

Congestion and queuing remain low at Mendota Street with BRT service. The modeling indicates all movements operate at LOS D or better and the overall intersection operates at LOS A with 9.3 seconds of delay.

c. PM Peak Hour

Congestion and queuing are low at Mendota Street in the Base Conditions (without BRT) with all movements operating at LOS D or better. The overall intersection operates at LOS B with 12.4 seconds of delay per vehicle.

Congestion and queuing remain low at Mendota Street with BRT service. The modeling indicates all movements operate at LOS D or better, except the northbound left which is just into the LOS E range with 57.9 seconds of delay per vehicle and a v/c ratio of 0.78. The overall intersection operates at LOS B with 11.2 seconds of delay.

4. Portage Road/Thierer Road

a. AM Peak Hour

Congestion and queuing are low at Portage Road/Thierer Road in the Base Conditions (without BRT) with all movements operating at LOS D or better. The overall intersection operates at LOS A with 5.0 seconds of delay per vehicle.

Adding BRT service does not change the intersection geometry. Similar to Base Conditions, all movements operate at LOS D or better. The overall intersection operates at LOS A with 5.4 seconds of delay per vehicle.

b. Noon Hour

Congestion and queuing are low at Portage Road in the Base Conditions (without BRT) with all movements operating at LOS D or better. The overall intersection operates at LOS A with 8.0 seconds of delay per vehicle.

Similar to Base Conditions, with BRT service all movements operate at LOS D or better. The overall intersection operates at LOS B with 18.8 seconds of delay per vehicle.

c. PM Peak Hour

Congestion and queuing are low at Portage Road in the Base Conditions (without BRT) with all movements operating at LOS D or better except the northbound left which operates at LOS E with 69.6 seconds of delay per vehicle. The overall intersection operates at LOS A with 9.2 seconds of delay per vehicle.

With BRT service all movements operate at LOS D or better. The overall intersection operates at LOS B with 13.9 seconds of delay per vehicle.

5. East Springs Drive

a. AM Peak Hour

Congestion and queuing are low at East Springs Drive in the Base Conditions (without BRT) with all movements operating at LOS D or better. The overall intersection operates at LOS A with 9.5 seconds of delay per vehicle.

Adding BRT service does not change the intersection geometry. Similar to Base Conditions, all movements operate at LOS D or better. The overall intersection operates at LOS B with 13.3 seconds of delay per vehicle.

b. Noon Hour

Congestion and queuing are low at East Springs Drive in the Base Conditions (without BRT) with all movements operating at LOS D, or better, except the westbound left which operates at LOS E with 64.4 seconds of delay per vehicle and a v/c ratio of 0.93. The overall intersection operates at LOS B with 15.9 seconds of delay per vehicle.

Similar to Base Conditions, with BRT service all movements operate at LOS D or better except one. The northbound right operates at LOS E with 56.2 seconds of delay per vehicle and a v/c ratio of 0.83. The overall intersection operates at LOS B with 14.5 seconds of delay per vehicle.

c. PM Peak Hour

Congestion and queuing are low at East Springs Drive in the Base Conditions (without BRT) with all movements operating at LOS D or better except the northbound right which operates at LOS E with 62.0 seconds of delay per vehicle and a v/c ratio of 0.86. The overall intersection operates at LOS B with 11.1 seconds of delay per vehicle.

Similar to Base Conditions, with BRT service all movements operate at LOS D or better except the northbound right which operates at LOS E with 68.8 seconds of delay per vehicle and a v/c ratio of 0.88. The overall intersection operates at LOS B with 11.7 seconds of delay per vehicle.

D. Provide Operations Analysis for Any Bus Signal Phases

The only intersection along US 151/East Washington Avenue where a bus only signal phase is proposed is at First Street. The BRT project anticipates using BRT buses to serve a north-south route that make an eastbound left turn at First Street. Considering that the phase would only be called once every 15 minutes and provide a brief 10-second phase, it will have little impact on the overall operations.

Synchro/SimTraffic software is not capable of modeling a signal phase that is called only once every six to nine signal cycles. Considering this, the project team used the following approach and assumptions to understand the impact of adding a bus-only phase at First Street:

- The bus-only phase will be called once every 15 minutes.
- The cycle length when the bus phase is called is extended by 10 seconds (modeled as a 10 second hold phase).
- The subsequent two cycle lengths are reduced by 5 seconds each to make up the 10-second bus phase and get the signal back into coordination.
- The operations reported here are a weighted average of the standard cycle length, the bus-only cycle (10 seconds longer), and two recovery cycles (5 seconds shorter each) rounded up to the number of full cycles occurring in 15 minutes.

Appendix F contains the HCS reports and weighted average calculations.

1. AM Peak Hour

The optimized cycle length at First Street in the BRT Synchro model is 140 seconds in the AM peak hour. This results in (rounding up) seven signal cycles in a 15-minute period, of which four will be 140 seconds, one will be 150 seconds (serving the 10-second bus only phase), and two will be 135 seconds (resynching the corridor signal progression over two cycles).

Table 3.01-3 compares the operations for key movements and overall using the BRT geometry without the bus phase and with it, to understand the impact the bus phase itself has on operations.

Movement	Operations	BRT without Bus Phase	BRT with Bus Phase
Eastbound Left	LOS	E (60.2 sec/veh)	E (70.9 sec/veh)
	V/C	0.57	0.66
Westbound Left	LOS	E (66.9 sec/veh)	E (70.1 sec/veh)
	V/C	0.56	0.59
Westbound Through	LOS	E (73.3 sec/veh)	E (63.6 sec/veh)
	V/C	1.07	1.04
Northbound Left	LOS	LOS F (107.1 sec/veh)	F (116.5 sec/veh)
	V/C	1.00	1.03
Southbound Left	LOS	E (71.0 sec/veh)	E (73.2 sec/veh)
	V/C	0.66	0.67
Southbound Through	LOS	F (89.8 sec/veh)	F (95.1 sec/veh)
	V/C	0.85	0.81
Overall	LOS	E (60.4 sec/veh)	E (56.4 sec/veh)
	V/C	1.00	1.00

sec/veh=seconds per vehicle

Table 3.01-3 2024 AM Operations at First Street with BRT Geometry and without Versus with a Bus-Only Signal Phase

2. Noon Hour

The optimized cycle length at First Street in the BRT Synchro model is 125 seconds in the noon hour. This results in (rounding up) eight signal cycles in a 15-minute period, of which five will be 125 seconds, one will be 135 seconds (serving the 10-second bus only phase), and two will be 120 seconds (resynching the corridor signal progression over two cycles).

Table 3.01-4 compares the operations for key movements and overall using the BRT geometry without the bus phase and with it, to understand the impact the bus phase itself has on operations.

Movement	Operations	BRT without Bus Phase	BRT with Bus Phase
Eastbound Left	LOS	E (56.3 sec/veh)	E (56.0 sec/veh)
	V/C	0.67	0.67
Westbound Left	LOS	E (58.1 sec/veh)	E (64.3 sec/veh)
	V/C	0.52	0.57
Southbound Left	LOS	E (69.5 sec/veh)	E (68.0 sec/veh)
	V/C	0.81	0.81
Overall	LOS	C (33.0 sec/veh)	C (32.0 sec/veh)
	V/C	0.76	0.76

sec/veh=seconds per vehicle

Table 3.01-4 2024 Noon-Hour Operations at First Street with BRT Geometry and without Versus with a Bus-Only Signal Phase

3. PM Peak Hour

The optimized cycle length at First Street in the BRT Synchro model is 135 seconds in the PM peak hour. This results in (rounding up) seven signal cycles in a 15-minute period, of which four will be 135 seconds, one will be 145 seconds (serving the 10-second bus only phase), and two will be 130 seconds (resynching the corridor signal progression over two cycles).

Table 3.01-5 compares the operations for key movements and overall using the BRT geometry without the bus phase and with it, to understand the impact the bus phase itself has on operations.

Movement	Operations	BRT without Bus Phase	BRT with Bus Phase
Eastbound Left	LOS	E (56.8 sec/veh)	E (59.6 sec/veh)
	V/C	0.76	0.79
Eastbound Through	LOS	F (154.0 sec/veh)	F (129.6 sec/veh)
	V/C	1.27	1.21
Westbound Left	LOS	E (69.5 sec/veh)	F (109.0 sec/veh)
	V/C	0.59	0.70
Southbound Left	LOS	F (188.3 sec/veh)	F (181.4 sec/veh)
	V/C	1.19	1.17
Southbound Through	LOS	E (65.0 sec/veh)	E (63.5 sec/veh)
	V/C	0.74	0.73
Overall	LOS	F (105.9 sec/veh)	F (92.7 sec/veh)
	V/C	1.14	1.14

sec/veh=seconds per vehicle

Table 3.01-5 2024 PM Operations at First Street with BRT Geometry and without Versus with a Bus-Only Signal Phase

The operations modeling indicates the addition of a bus-only phase that occurs only once every 15 minutes has mostly negligible impacts on operations at US 151/East Washington Avenue and First Street. Some movements experience increased delay while others experience decreased delay. For all three hours considered, the overall intersection delay and v/c ratio is the same, or a little less, with the added bus phase.

East-West BRT: US 151/East Washington Avenue Operations Analysis Bus Only Phase at First Street

The bus-only phase will be called once every 15-minutes.

The cycle length when the bus phase is called is extended by 10 seconds (modeled as a 10 second Hold phase).

The subsequent two cycle lengths are reduced by 5 seconds each to make up the 10 second bus phase and get the signal back into coordination.

The operations reported here are a weighted average of the standard cycle length, the bus only cycle (10 seconds longer) and two recovery cycles (5 seconds shorter each) rounded up to the number of full cycles occurring in 15-minutes.

APPENDIX G
SUMMARY OF WISDOT COMMENTS AND BRT PROJECT TEAM REPLIES

ID	Document	Page	Comment Made by Initials	Comment (Limit to One Item Per Row)	Agree	Response	Follow-Up	Additional Notes
1	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM	1. The BRT Traffic Report indicates LTS ranges from 2 to 2.5 between Blair Street and Marquette Street. The report further states that segment will have an LTS of 4.0 during peak periods in the peak directions when the bike/parking lane becomes a traffic lane and bicycles will need to take the lane and ride in mixed traffic or seek another route.	Yes	Correct. The numbers cited in the report were calculated considering the LTS criteria for corridors and averaged across the factors that are included (see the attached spreadsheet). The scores use a slightly different methodology than the ratings developed by the MPO, as seen on the MPO's Low-Stress Bike Route Finder map (https://www.arcgis.com/apps/webappviewer/index.html?id=cb7a2e78477044c19bf6a5eaa1820e38). The MPO methodology includes probe data for the speed input as well as approach and intersection LTS.		
2	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM	2. The BRT Traffic Report does not mention bike accommodations or LTS for other sections of E Washington within the BRT corridor. I assume that if the report doesn't mention bike accommodations or changes, the existing facilities will remain as they are today.	Yes	Correct. East of Marquette Street there are no changes to the bike facilities. Based on the spreadsheet corridor calculation, from Marquette Street to Wright Street and from Mendota Street to Portage Road/Thierer Road the LTS without BRT and with BRT is 2.0. From Portage Road/Thierer Road to East Springs Drive the LTS without BRT and with BRT is 2.3.		
3	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM	3. I have indicated LTS shown in the MPO Low-Stress Bike Route Finder for routes not mentioned in the BRT report:	Yes	As noted above this MPO map uses a slightly different methodology than the spreadsheet calculations for the corridor LTS.		
4	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM	a. Webster St - USH 151/Blair St - no bike lanes existing or with BRT – LTS 4 exist/4 BRT.	Yes	i. Note that this is not part of the US 151 Connecting Highway. ii. There is an existing bike lane in the westbound direction that will remain. Eastbound there is not a bike lane, and that is being evaluated. iii. Eastbound LTS above correct per the MPO map. iv. The BRT service does not alter the existing bike LTS. v. The City is seeking to strengthen Main Street as a cycling corridor (LTS 2), and recently requested a signal at the Main Street/Blair intersection for pedestrians and cyclists.		
5	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM	b. Blair St - Blount St WB -bike lanes existing, no bike lane with BRT – must share vehicle lane – LTS 4 exist/4 BRT.	Yes	i. With existing conditions and per the MPO map there is no bike lane WB in this section (LTS 4). However, a 4-ft marked lane (adjacent to a 10-ft travel lane) will be added with WisDOT's Blair Street pavement replacement project scheduled for 2023. See https://www.cityofmadison.com/engineering/projects/blair-street-south ii. The spreadsheet corridor calculation (after construction of WisDOT's Blair Street improvements) is LTS 1.8 exist/1.8 BRT.		
6	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM	c. Blount to Livingston WB – no bike lanes existing or with BRT – must share vehicle lane – LTS 4 exist/4 BRT.	Yes	i. With existing conditions and per the MPO map there is a shared parking/bike lane WB in this section (LTS 3). ii. With BRT, per the spreadsheet corridor calculation LTS 2.0 exist/2.0 BRT 22-hrs off-peak, 4.0 BRT 2-hr peak period.		
7	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM	d. Blair St – Livingston St EB – bike lane or combined bike/parking lane existing, no bike lane with BRT – must share vehicle lane – LTS 2 - 3 exist/4 BRT.	Yes	i. Existing is correct per the MPO map. ii. To be more precise: Blair to Blount EB the existing bike lane remains, spreadsheet corridor calculation LTS 1.5 exist/1.5 BRT; iii. Blount to Livingston EB per the spreadsheet corridor calculation LTS 2.0 exist/2.0 BRT 22-hrs off-peak, 4.0 BRT 2-hr peak period.		
8	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM	e. Livingston St – Milwaukee St – combined bike/parking lane existing, no bike lane with BRT – must share vehicle lane – LTS 2 – 3 exist/4 BRT	Yes	i. Existing correct per the MPO map. ii. Per the spreadsheet corridor calculation: Livingston to Baldwin LTS 2.0 exist/2.0 BRT 22-hrs off-peak, 4.0 BRT 2-hr peak period; iii. Baldwin to Milwaukee LTS 2.3 exist/2.3 BRT 22-hrs off-peak, 4.0 BRT 2-hr peak period.		
9	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM	f. Milwaukee St – Stoughton Rd - bike lane existing and with BRT – LTS 4 exist/ 4 BRT.	Yes	i. Per the MPO map existing LTS 3. The BRT does not use US 151/E Washington from Wright Street to Mendota Street. Conditions are unchanged with BRT. ii. Per the spreadsheet corridor calculation Milwaukee to Wright Street LTS 2.0 to 2.5 exist/2.0 to 2.5 BRT 22-hrs off-peak, 2.0 to 4.0* BRT 2-hr peak period (*4.0 WB WIS 30 to Milwaukee Street only).		
10	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM	g. Stoughton Rd - Thierer Rd – bike lane existing and with BRT – LTS 4 exist/ 4 BRT.	Yes	i. Existing correct per the MPO map. The BRT does not use US 151/E Washington from Stoughton Road to Mendota Street. The BRT does not modify the bike accommodations from Mendota Street to the east. ii. Per the spreadsheet corridor calculation Mendota to Portage/Thierer LTS 2.0 exist/2.0 BRT		
11	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM	h. Thierer Rd – E Springs Dr - bike lanes existing and with BRT – LTS 4 exist/ 4 BRT.	Yes	i. Existing correct per the MPO map. ii. Per the spreadsheet corridor calculation Mendota to Portage/Thierer LTS 2.3 exist/2.3 BRT		
12	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM	5. Based on my review, I would say that there are some segments with bike lanes or bike/parking lanes during non-peak times with LTS 2 to 3. Those segments during peak periods in the peak direction, will have LTS of 4.	Yes	Correct, based on the calculations in the spreadsheet.		
13	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM	6. Remaining segments either have no bike lanes or higher traffic volumes for LTS of 4 at all times. See above.	Yes	The MPO map uses a slightly different methodology in assigning LTS. In the areas outside where shared parking lanes are provided US 151/E Washington Avenue generally has an on-street bike lane more than 6-feet wide (including the gutter pan) and a spreadsheet corridor calculation LTS of 2.0 to 2.5 both existing and with BRT.		
14	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM	7. Please provide remedial measures that are being undertaken to mitigate segments with LTS 4.	No	For much of the corridor there is no change in bicycle LTS with the addition of BRT service. Generally, from Blair Street to Marquette Street where a shared parking/bicycle lane exists the LTS will remain at existing levels (2.0 to 2.5) for 22 hours on weekdays (and all day Saturday and Sunday). For 2 hours westbound/inbound on weekday mornings and 2 hours eastbound/outbound on weekday afternoons the LTS increases to 4.0 for travel along US 151/East Washington Avenue. The City prefers to limit parking restrictions to only the period absolutely necessary to provide motor vehicle LOS acceptable to WisDOT. If WisDOT is willing to accept higher motor vehicle delays, the City could explore maintaining the parking and bike facility full time.	No	WisDOT accepts the higher LTS in the peak periods, as higher motor vehicle delays would lead to unacceptable operations along the corridor. WisDOT is not open to maintaining the parking and bike facilities full time as acceptable LOS cannot be maintained during the peak hours.
15	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue		WisDOT-MM		Yes	Along this entire portion of the corridor there are nearby parallel facilities with LTS of 1.0 to 2.0, the majority of which are within one block of US 151/East Washington Avenue and often times exist to both the north and the south. The BRT project will not propose additional improvements to parallel or alternate bike accommodations as part of the BRT project. The City of Madison has incorporated East Madison Bicycle Enhancements as part of the Safe Streets Capital Budget Request. Many of the projects in this budget item would strengthen east-west bicycle facilities from the Capitol to Highway 30.		
16	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue	ES-2	WisDOT	The Dane County Demand Model show 0.94% growth, and recent 2020 Census data indicate a 1.5% county-wide growth, and socio-economic in the next version of the TDM indicate infill along the East Washington Ave corridor, all which support the recommended growth rate. Please remove the statement, "It is likely the sensitivity analysis volumes will not be reached by 2034."	Yes	Statement will be removed.		

17	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue	1-8	WisDOT	Were signal timings and split optimized for non-BRT conditions in 2024 & 2034 analyses? If not, why?	No	The signal timings used in the non-BRT conditions in 2024 & 2034 were not changed from the original City of Madison models because they represent the current signal timings that are in place ("existing conditions", or non-BRT). The modeling approach is intended to demonstrate how conditions with BRT will compare with existing/recent conditions which the project team and reviewing authorities have a feel for from personally traveling along and across the corridor. The modeling demonstrates that by optimizing the signal timings and coordination and using longer cycle-lengths travel along the State and US routes is minimally impacted by BRT compared to existing conditions. No changes proposed.		
18	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue	ES-5 & 3-11	WisDOT	Can First St intersection queues be further detailed?	Yes	<p>2024 AM longest 95th Percentile Queues from Synchro on US/WIS Route Approaches</p> <ul style="list-style-type: none"> - No BRT EBT: 176-ft - With BRT EBT: 290-ft - No BRT WBT: m#952-ft - With BRT WBT: #1175-ft - No BRT SBT: #249-ft - With BRT SBT: #276-ft <p>2024 MID longest 95th Percentile Queues from Synchro on US/WIS Route Approaches</p> <ul style="list-style-type: none"> - No BRT EBT: 25-ft - With BRT EBT: 643-ft - No BRT WBT: 83-ft - With BRT WBT: 555-ft - No BRT SBL: #247-ft - With BRT SBL: #232-ft <p>2024 PM longest 95th Percentile Queues from Synchro on US/WIS Route Approaches</p> <ul style="list-style-type: none"> - No BRT EBT: #1132-ft - With BRT EBT: #1482-ft - No BRT WBT: 276-ft - With BRT WBT: #825-ft - No BRT SBL: #269-ft - With BRT SBL: #366-ft 		
19	30% Plans	209	WisDOT	Please clarify lane alignments/utilization inbound in AM between Livingston to Blair. It appears the two left lanes at the Livingston intersection align with the left-turn only lanes. This may lead to unnecessary lane changes/weaving.	Yes	Upstream of Livingston Street the Bus lane is on the left/median side, the leftmost GP lane must turn left at Blair, the middle GP lane can turn left by making one lane change to the left between Livingston Street and Blount Street or can stay in their lane to go through, the rightmost GP lane traffic (in the bike/parking lane) will likely go through at Blair Street. Buses will make one lane change to the right between Livingston Street and Blount Street.		
20	Traffic Analysis for Bus Rapid Transit on US 151/East Washington Avenue	ES-3	WisDOT	In last line of second paragraph, please clarify to what LTS level is increased to. (Currently shows "xx")	Yes	Report will be updated as follows: "... increases the LTS to 4.0 because cyclists must take a full travel lane."		
21	Models		WisDOT	Detail queues from left turn conversions to protected-only, will queues be backing up into thru lanes?	Yes	<p>No, the queuing reports do not indicate that left-turn movements converted to protected-only phasing will back into thru lanes. Results below are from Synchro11 output. The only left-turn where queuing may use all of the available storage is in the PM peak with BRT for the westbound left-turn at Marquette Street. As noted in the report, observation of SimTraffic simulation does not suggest the westbound left operations or queuing are of concern for westbound US 151/ East Washington Avenue traffic.</p> <p>2024 AM locations converted from permitted to protected-only left-turns 95th% Queues</p> <ul style="list-style-type: none"> - No BRT Paterson WBL: <m25-ft - With BRT Paterson WBL: m40-ft/180-ft storage* - No BRT Baldwin WBL: <m25-ft - With BRT Paterson WBL: 81-ft/130-ft storage - No BRT First WBL: <m25-ft - With BRT First WBL: 107-ft/130-ft storage - No BRT Fourth EBL: m#56-ft - With BRT Fourth EBL: #73-ft/115-ft storage - No BRT Milwaukee EBL: m29-ft - With BRT Milwaukee EBL: m57-ft/135-ft storage - No BRT Marquette WBL: <m25-ft - With BRT Marquette WBL: m123-ft/170-ft storage <p>2024 MID locations converted from permitted to protected-only left-turns 95th% Queues</p> <ul style="list-style-type: none"> - No BRT Paterson WBL: <m25-ft - With BRT Paterson WBL: m29-ft/180-ft storage* - No BRT Baldwin WBL: <m25-ft - With BRT Paterson WBL: #92-ft/130-ft storage - No BRT First WBL: <25-ft - With BRT First WBL: 94-ft/130-ft storage - No BRT Fourth EBL: <m25-ft - With BRT Fourth EBL: 38-ft/115-ft storage - No BRT Milwaukee EBL: 36-ft - With BRT Milwaukee EBL: m53-ft/135-ft storage - No BRT Marquette WBL: <25-ft - With BRT Marquette WBL: 33-ft/170-ft storage <p>2024 PM locations converted from permitted to protected-only left-turns 95th% Queues</p> <ul style="list-style-type: none"> - No BRT Paterson WBL: m#86-ft - With BRT Paterson WBL: m#46-ft/180-ft storage* - No BRT Baldwin WBL: 27-ft - With BRT Paterson WBL: #112-ft/130-ft storage - No BRT First WBL: 38-ft - With BRT First WBL: 98-ft/130-ft storage - No BRT Fourth EBL: <m25-ft - With BRT Fourth EBL: <25-ft/115-ft storage - No BRT Milwaukee EBL: <m25-ft - With BRT Milwaukee EBL: m61-ft/135-ft storage - No BRT Marquette WBL: 43-ft - With BRT Marquette WBL: #169-ft/170-ft storage <p>* Storage measured from stop-bar to point at which left-turn lane is approximately 8-ft wide from face of curb to adjacent through lane edge.</p>		
22	6-month and 1 year check-in after facility is operational - Signal Timings and operations (no-parking etc.)		WisDOT	We will want to ensure updated signal coordination patterns are installed and running, as updating timing plans are vital to maintaining acceptable LOS. Also, prohibited left-turns and parking are working as envisioned.	Yes	The City agrees to continue coordinating with WisDOT regarding operations along US 151/ East Washington Avenue including 6-month and 1-year check-ins after BRT service begins.
