For nearly a decade, Musco has been testing the Light Emitting Diode (LED) light source and applying in on projects in which it was the best option. While LED saved energy, for a typical recreational facility the hours of operation weren’t great enough to offset the higher cost.

With our Total Light Control—TLC for LED® technology, we’ve paired our expertise in light control with the advancing output of LED to the point where it’s a cost-effective option for recreational facilities.

The result is a system that makes Musco’s great lighting even better.

**Better for Players...** who want to perform their best and be able to track the entire flight of the ball.

**Better for Neighbors...** who don’t want glare in or around their homes or lights left on when not in use.

**Better for the Night Sky...** with bright, uniform light directed onto the field and not spilling above it.

GLARE IMPACT

Summary

Map indicates the maximum candela an observer would see when facing the brightest light source from any direction.

A well-designed lighting system controls light to provide maximum useful on-field illumination with minimal destructive off-site glare.

GLARE

Candela Levels

High Glare: 150,000 or more candela
Should only occur on or very near the lit area where the light source is in direct view. Care must be taken to minimize high glare zones.

Significant Glare: 25,000 to 75,000 candela
Equivalent to high beam headlights of a car.

Minimal to No Glare: 500 or less candela
Equivalent to 100W incandescent light bulb.

Candelas: 150,000 100,000 50,000 5,000 1,000 500 250
